

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### **Usage guidelines**

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## LETTER L.

Carver—Middleborough—Taunton, its manufactures—Halifax—Bridgewater—Honourable Hugh Orr—Raynham—Longevity of the Leonard family—Philip, King of the Wampanoags—Attleborough—Rev. Habijah Weld—Rehoboth—Indian depredations—North Providence.

*Dear Sir,*

ON Wednesday, October 15th, we took leave of our friends at Charlestown, and rode through Boston, Roxbury, Milton, Quincy, Braintree, Weymouth, and a skirt of Hingham, to an inn, in the Western part of Scituate: thirty miles. The next day we reached Plymouth, seventeen miles, at noon; where we lodged in the hospitable house of Mr. H. a respectable merchant, and my particular friend. As I shall have occasion to mention this tract hereafter; I shall omit a description of it for the present.

The next morning we pursued our journey through Carver, eight miles, and Middleborough, thirteen, to Taunton, twenty-six.

Immediately after we left Plymouth we ascended the brow of a vast, yellow-pine plain, spreading over a great part of the County of Plymouth, a part of the County of Bristol, and a part of the State of Rhode-Island. This is the largest tract of lean land in Massachusetts; and the least productive. The road is generally a heavy sand, over which our horses made their way with difficulty. An entire sameness of prospect every where wearied the eye; and approached in many places, towards absolute desolation. It was, however, not unfrequently varied by a succession of small lakes, spread, at moderate distances, throughout the whole tract; clear, beautiful and salubrious. Around most of them were settled a few planters, on a tolerably good soil, furnished by

the surrounding declivity. Several of them, also, yield considerable quantities of iron ore; which is raked from their beds, and serves well for castings, and sometimes is wrought by the hammer. The Eastern parts of this tract are inferior to the Western; but even these yield small crops of rye and maize.

Carver the first township, which presented itself to us after we left Plymouth, is a lean-looking collection of thinly scattered plantations. The houses are old, and ordinary: and the whole aspect of the country is discouraging. Every thing appears as if it had been long at a stand; and as if it could scarcely again become progressive.

There is an iron furnace in this town, supplied by one of the lakes, to which I have referred. It is said to have yielded 500 tons of iron ore in a year; and sends out the stream, upon which the furnace is built.

Carver was incorporated in 1790, and contained, then, 847 inhabitants; in 1800, 124 dwelling houses, and 863 inhabitants; and in 1810, 858.

Middleborough, the next township Westward, lies on the same plain; varied, however, with a few rising grounds; low, sloping gradually, but destitute of beauty. The soil is somewhat harder, and more productive, than in Carver; the forests are interspersed with oak and hickory; the houses wear a better appearance; and the inhabitants are obviously in more thrifty circumstances. But the same general uniformity of surface, the sterility of the soil, the unthriftiness of the forests, the want of that verdure, so generally spread over New-England, and the stillness of the whole region, make the passage through this township monotonous, and dull, to a traveller. The church is a decent building: and in its neighbourhood there are three or four dwelling houses, of a similar appearance.

The agriculture of Middleborough is devoted almost wholly to the production of maize, and rye: both of which grow in considerable quantities.

Wheat was formerly cultivated here with success by the Hon. Peter Oliver; at that time one of the Judges of the Superiour

Court in the Province of Massachusetts-Bay. This very respectable man was distinguished for his knowledge, and love of agriculture, as well as for his good sense integrity and candour.

In the winter season, the inhabitants of Middleborough are principally employed in making nails; of which they send large quantities to market. This business is a profitable addition to their husbandry; and fills up a part of the year, in which, otherwise, many of them would find little employment. Several small lakes, particularly one called Assawampsit, furnish, and have long furnished, large quantities of iron ore; and are well stored with fish. One of the first rolling and slitting mills in New-England was erected here, about the middle of the eighteenth century.

Middleborough contains one parish, and a part of two others. Within the limits of the three, there are six congregations: three Presbyterian, and three Baptist. In 1776, there was 4,479 inhabitants in this township; in 1790, 4,526; in 1800, 4,458, and 709 dwelling houses; and, in 1810, 4,400.

Its Indian name was Nawasket.\*

\* The first precinct or parish of Middleborough contains between thirteen and fourteen hundred people. The following bill of mortality, contains an account of the number of persons who died here between 1801 and 1813, and their ages: 1811 is not given.

Years.	Above 90,	80,	70,	50,	20.	Under 20.	Total.
1802	1	3	2	2	3	8	19
1803	1	4	2	4	4	16	31
1804		4	1	7	2	6	20
1805			6	3	14	6	29
1806	1		3		1	7	12
1807		5	2	5	6	4	22
1808		2	10	7	4	8	31
1809		2	4	7	4	12	29
1810		2	3	4	5	6	20
1812	4	2	4		5	7	22
Total,	7	24	37	39	48	80	235

From this table it appears that the average number of deaths in this precinct, was 23.5. Of the whole number 235, seven, one thirty-third part, lived to be above 90; and twenty-four, a tenth part, above 80; thirty-seven, nearly a sixth part, above 70; and sixty-eight, the whole number that died above 70, was a little less

Taunton lies immediately West of Middleborough, and on both sides of Taunton river. The surface is more varied than that of Middleborough; the soil materially better; the fields more verdant; the forests, which are principally oak, hickory, &c. more thrifty; and the whole aspect of the country, especially near the river and its tributary streams, much more sprightly and agreeable. The town is built on the Western side of the river, upon the borders of a pretty mill stream. Its situation is naturally pleasant. The houses, amounting to fifty or sixty, are generally decent; but are too much crowded together. The rest of the town is formed into plantations, except a village at the landing, about a mile and a half further down the river. To this place ascend the coasting vessels, which carry on the trade of Taunton.

Taunton is the shire town of the County of Bristol; and contains a Court-house and Gaol, an Academy and three churches. The Presbyterian church is prettily placed on a handsome green; and the Court-house on another, less pleasant, about one hundred rods further down the river. None of these buildings are remarkable for their beauty.

Great quantities of iron are manufactured here; not less, it is supposed, than 800 tons annually. Of this, one half is converted into nails; and the rest into shovels, castings, &c. The first iron shovels, manufactured in the British Colonies, were made by Mr. Samuel Leonard.

Were I to judge from what I saw, and heard, I should conclude, that the inhabitants have suffered in their morals, from the sessions of courts, and the influence of furnaces and forges.

Taunton was incorporated in 1639. It seems to have suffered less from the savages, than most other places in the same unprotected situation. It is said, that Philip regarded the people of Taunton, (then including Raynham,) and Bridgewater, with so much good will, as to declare, that they should be the last victims of his revenge.

than one third of the whole total. One hundred and eight died above 50, not far from one half; while those who died under 20 were eighty a little more than one fourth of the whole.

In the year 1790, Taunton contained 538 houses, and 3,804 inhabitants, in 1800, 560 houses, and 3,860 inhabitants, and in 1810, 3,907. It includes also four congregations; two Presbyterian, one Episcopal, and one Baptist.

In a journey which I took to Hallowell in the year 1807; a journey which I shall have frequent occasion to mention hereafter; we proceeded, on our return, from Boston to Hingham on Monday, the 12th of October. The next day we rode to Plymouth before dinner.

Here we had the satisfaction of being present while a luminous and impressive charge was delivered to the Grand Jury of the County by the Hon. Theophilus Parsons, Chief Justice of Massachusetts. I know not, that I have ever heard a moral discourse, which was conducted with more skill. The scheme of thought was in the highest degree clear, and correct; and the style eminently distinguished for its perspicuity, precision, and strength. The definitions were obvious, and complete; the arguments conclusive, and the discussions introduced exactly where they were necessary, and were extended no farther than they were necessary. The whole was so concise, that from almost any writer it would have been obscure; yet was so managed as to become more intelligible from its succinctness. It was received by a numerous audience with a solemn, profound, and eager attention.

After the charge was ended, we dined with the Court; and were not a little gratified with the conversation at the table.

The remainder of the day we spent with our Plymouth friends, in examining the antiquities of this place, so interesting to every genuine New-Englander.

We found Plymouth considerably improved.

Wednesday October 13th, we left Plymouth in the morning, and rode to Taunton, through Kingston, Halifax, Bridgewater, and Raynham: thirty miles. We took this road in preference to the direct course through Middleborough, although it is four miles further, on account of the sand, with which that was en-

cumbered; and found the route more expeditious, as well as more pleasant.

Halifax is a collection of scattered plantations on a soil, partly sand and partly loam. The Eastern division of this township is pine plain. The Western is composed of easy gradual swells, and open vallies; both covered with loam, and moderately fertile. The hills are stony.

This township has the aspect of having been long settled, and appears to have arrived at the ne plus of its present system of cultivation. On the houses, generally approximating to the age of a century, at least to the eye, there are scarcely any marks of recency or repair. The inhabitants, also, appear to be fixed in their moderate, comfortable circumstances; and to have arrived at a termination in the progress of improvement, in their ambition, and in their hopes. Unless something entirely new should start up, to communicate to them a high excitement, this township will most probably wear the same face at the end of another century, which it wears now; without any perceptible alteration in its buildings, agriculture, manners or character.

Halifax was incorporated in 1734; and in 1790 contained 664 inhabitants, included in 124 families; in 1800, 642 inhabitants, and 95 dwelling-houses; and in 1810, 703 inhabitants.

The township of Bridgewater is an alternation of small plains, easy swells, and open vallies; presenting a prospect which is rather agreeable.

The soil, though not remarkably fertile, is better than that of Halifax. We passed two or three handsome lakes, lying, as we supposed, in this township; the largest extending from two to three miles in length. Here, and in the neighbourhood, there are several marshy grounds, producing the swamp cedar, mentioned above, in such numbers, as to supply shingles in sufficient quantity for the surrounding country.

The houses in this township exhibit more appearances of thrift and prosperity, than those of Halifax. Generally, however, the same stillness, the same aspect of antiquity, the same evidence of an arrival at a stand in the course of improvement are presented in

those parts of the township, through which our journey lay. Yet it is said to contain considerable manufactures of iron, for various purposes. It is crossed by one branch of Taunton river.

Within the limits of Bridgewater commences that vast field of sand, which, running Southward, abuts upon the Sound at Rochester, and running Eastward, upon the Massachusetts Bay, at Scituate.

The late Hon. Hugh Orr, an inhabitant of Bridgewater, deserves to be mentioned here with particular respect, both on account of his personal character, and the skill, and enterprise with which he promoted various manufactures of iron in this country. Mr. Orr was born January 13th, 1717, at Lochwinioch, in the county of Renfrew in Scotland. He was educated a gunsmith, and house-lock filer; and at the age of twenty came to America. One year he resided at Easton in this neighbourhood; and the next removed to Bridgewater. Here he built a shop; and set up the first trip-hammer in this part of the country. His first business was the manufacturing of scythes; thence he proceeded to that of axes; and was for several years the only maker, of edge-tools, of which he seems to have manufactured many sorts, in this part of the country.

In the year 1748 he made five hundred musquets, for the province of Massachusetts Bay.

During the Revolutionary War, Mr. Orr commenced anew the manufacturing of arms; and set up in concert with a French Gentleman, a foundery for the casting of cannon. These were cast solid, and bored; most of them were iron; a few were brass. A great quantity of cannon shot was also cast at the same furnace, and together with the cannon formed a very interesting acquisition to the country at that period.

Beside spreading the manufacture of edge tools through various parts of Massachusetts Bay, Rhode-Island, and Connecticut, Mr. Orr originated the business of exporting flaxseed from this part of the country; and probably gave the first spring to the manufacturing of cotton.

In social life he is represented as amiable, and irreproachable. As a friend to this country, though not born in it, he was distinguished. For several years he was elected a Senator for the County of Plymouth; and, what may stand in the place of a volume of panegyric, he was a confidential friend of the late Governour Bowdoin. Mr. Orr died, December 1798, in the eighty-second year of his age.\*

An Academy was incorporated in this township, February 1799. It is under the superintendence of the Rev. Dr. Sanger; and is said to be flourishing.

Bridgewater contains five parishes. In 1790 the inhabitants amounted to 4,975, included in 830 families; in 1800, to 5,200, living in 740 houses; and, in 1810, to 5,157.

Raynham has the same kind of soil with that of Bridgewater. Along the road, however, the surface is more level, and more sandy. The inhabitants appear to be in pleasant circumstances; and the houses are generally well-built.

The people of Raynham, Bridgewater, Taunton, and some other townships in this vicinity, are extensively employed in the business of manufacturing iron. In the two counties of Plymouth, and Bristol, there are twenty furnaces, and as many forges; a number of slitting and plating-mills; and a great number of people employed in the manufacture of nails, and other articles, of which iron is the material. The ore, of which a great part of this iron is made, is found in marshy grounds, where, if I may be allowed the term, it is continually growing. The proof of this fact is said to be complete: for, where it has been exhausted, it is found again in a few years, in considerable quantities. That, which has been very lately produced, is said, however, to be in an immature state, and unfit for casting.

The first forge, erected in America was built in Raynham by James and Henry Leonard. The family, derived from James, have ever been extensively employed in manufacturing iron down to the present time; and have been much distinguished for respectability of character. Nor have they been less remarkable for longevity.

\*Hist. Coll. Vol. ix.

James Leonard, the progenitor of the family, had three brothers. Including these, himself, and his descendants, amounting in all to forty-four males, the ages on this side of the family are as follows:—

4 aged, but age not certainly known,	3 near 80,
3 almost 70,	11 above 80,
9 above 70,	5, age unknown.
9 averaging 74,	—
	44

Of his female descendants, amounting to twenty-five,

2 were aged,	1 above 90,
5 were almost 70,	1 almost 100,
3 74,	6 age unknown.
4 above 75,	—
3 above 80,	25

All these, except the progenitor, were his immediate descendants in direct lines.

Of the males all, except five, lived to be above sixty. All except twelve, (or thirty-two out of forty-four,) lived to be above seventy; twenty-three above seventy-four; and eleven above eighty.

Of the twenty-five females, all, except eight, lived to be near seventy; probably all but six; twelve lived to be seventy-four; nine exceeded seventy-five: five were above eighty: one above ninety: and one almost an hundred.

The Rev. Dr. Wales, late Professor of Theology in Yale College, was a native of Raynham, and a descendant by the mother's side from the family of Leonard. This gentleman was greatly and deservedly respected as a scholar, and a divine; and filled the offices of a parochial minister, and a Professor of Divinity in Yale College, with high reputation.

Raynham was incorporated in the year 1731. The inhabitants have been distinguished for their love of good order, and their attachment to the government of the State. "Among their number," says the Rev. Dr. Fobes, their late minister, "was never found a tory, a friend to paper money, or an insurgent."

In 1790, this township contained 164 houses, 197 families, and 1,094 inhabitants; in 1800, 1,181 inhabitants; and in 1810, 1,154.

Raynham was the summer residence of Metacom, or Philip, chief sachem of the Wampanoags, or Pokanokets, sometimes written Pawkunnawkuts.\* During the winter he lived in Bristol, in the State of Rhode-Island. This prince made a greater figure in the history of New-England than any other man, among the numerous tribes of Mohekanneews. His father, as has been already observed, was the celebrated Massasoit, who welcomed the Plymouth Colonists to America, and was their faithful friend throughout his life. Massasoit was naturally frank, friendly, and honourable. No stain has been left upon his character by history; and there is reason to believe, that he died a Christian.

Alexander, the eldest son of Massasoit, died a young man, and left the Sachemdom to Philip. The views, which Sassacus entertained concerning the settlement of the English, and which he expressed so strongly to the Narrhagansetts, when he attempted to unite them with the Pequods in a war against the Colonists, Philip imbibed early; and never lost sight of them until his death. He was sagacious, also, beyond the ordinary reach of savage minds; and possessed in a singular degree the skill, and address, in negociation, which alone can persuade men, mutually hostile in their feelings and interests, to unite heartily in a common cause. The Indians of New-England had never known any interests, but such as were merely local. Himself, his family, and his tribe, include every thing, which is valuable in the eyes of a savage. These are his world; and whatever does not intrude upon their welfare is to him nothing. By present objects, and their immediate consequences, he is roused to attention, and, as the case may be, to action; but those, which are remote, lie beyond the limits of his horizon. Philip, however, passed these limits. He saw the Colonists increasing daily in numbers, and in power; and seems clearly to have discerned, that at no distant period their establishment on these shores would become fatal to the independence, and safety, of his countrymen.

\*This is the spelling of Major-General Gookin.

Engrossed by these views, he began early to adopt such measures, as might most effectually prevent the evils, which he dreaded. The field, in which he was to act, was unpromising. Every Indian tribe is of course hostile to every other. The larger are insolent; the smaller, impatient to revenge their wrongs; and all, mutually and intensely jealous. To fight with each other, and to subdue or be subdued, constitute their only employment, and their only lot. Those, who were near the English, might easily be persuaded to direct, and would indeed of course direct, their jealousy against them, unless when at war with their own countrymen. But those, who were at a distance, were too much occupied in their own concerns, and too apprehensive of danger from their neighbours, to permit the indulgence of any serious hope of success in attempts to excite their jealousy against the English. Philip, however, was not discouraged. With the peculiar secrecy, which characterizes this people, and which no nation, beside the French, has managed with equal success, he dispatched his runners first to the neighbouring tribes, and then to those which were more distant. To all he represented in strong terms the numbers, the power, the increase, and the unfriendly designs, of the Colonists, and the danger, with which they threatened all the original inhabitants. In various instances he pleaded the cause in person; and by himself, and his emissaries, made a deeper and more general impression than could easily have been believed, or than some discreet inhabitants in this country can even now be persuaded to admit.

These measures Philip laboured to conceal as much as possible from the English. He was probably employed in this business in 1671. Through the succeeding four years he was at times, and during the two last of them very generally, and strongly, suspected. To the accusations brought against him he replied with so much address, and in his behaviour was so adroit, as in a great measure to remove the suspicion, and preserve the good opinion of many, at least, among the Colonists.

While his affairs were in this situation, John Sausaman, an Indian, who was a disciple of Mr. Elliot, having been guilty of some

transgression against the laws of Christianity, fled to Philip, and became his confidential counsellor. Mr. Elliot, however persuaded him to return, after some time, to his praying brethren at Natick, and atone for his fault in the Christian manner. Sausaman, whose penitence was sincere, having afterwards met with Philip, and several of his chieftains at Middleborough, discovered his designs against the English, and felt himself obliged to disclose them to the Governour of Plymouth. The communication was made under the seal of absolute secrecy. Yet Philip, who strongly suspected Sausaman, partly from the jealousy, which is characteristical of Indians, and partly from knowing his disposition, ordered him to be dispatched. Accordingly, he was killed by three of Philip's Indians, as he was crossing a frozen pond. His body was put under the ice, as if he had accidentally fallen through, and been drowned. His hat and gun were, however, left upon the ice; and these led to the discovery of his body. One of his friends, who took him up, observed several bruises upon his head; and concluded, that violence had been done to him. This man, whose name was David, told the English at Taunton what he had seen, and what were his suspicions. The Governour of Plymouth ordered Sausaman's body to be taken out of the grave, and examined; when it was discovered, beyond a doubt, that he had been murdered. The murderers were apprehended; and were convicted by the testimony of an Indian, who providentially was on a hill near to the pond at the time, and had seen the murder committed. One of the three Indians also confessed that his father, a confidential friend to Philip, and the other Indian, who had been under trial, had killed Sausaman, while he looked on. The murderers were executed at Plymouth in June 1675. From this time Philip attempted to conceal his designs no longer, and began immediately a vigorous succession of hostilities.

The progress of the war, far the most distressing, which was ever experienced by the inhabitants of this country; its issue in the death of Philip; and the final ruin of Indian power in New-England; will hereafter be sufficiently detailed in the course of these letters. Whatever opinion we may form of this Chief, we

cannot deny, that he was a sagacious, brave, high-spirited man. His faults must in no small degree be ascribed by candour to the state of society, in which he was educated. The Colonists he considered, and justly, as dangerous intruders, whose views, and interests, were hostile to those of his countrymen. Their power, already formidable, he saw every day becoming more so; and their numbers continually increasing. The design, which he formed of delivering his country from this band of strangers, was exactly of the same nature with those, which mankind have generally pronounced patriotic, and glorious. Had he succeeded; (and there was a period, when his success was at least doubtful;) the tribes of this country would in their future songs have celebrated his name with the same enthusiasm, and in their traditions have twined round his temples the same laurels, which in Sweden have been devoted to Gustavus Vasa, and in England to Alfred; with which the Romans adorned the names of Camillus, and Scipio Africanus, and the Greeks commemorated those of Miltiades, Leonidas, and Cymon.

The house of Philip stood on the North side of a pond, called the Fowling-pond. It was called his hunting-house, because he spent the summer here in hunting. This Chief was peculiarly attached to the Leonard family; and gave strict orders to all his men, when the war commenced in 1675, to do them no injury.

In this journey I found Taunton somewhat improved. The completion of the bridge from Rhode-Island to Tiverton at Howland's ferry is believed here to be an object of considerable importance to all this part of the country. The road from Newport to Boston passes through Taunton; furnishes the inhabitants along the Eastern shore of New-England with the shortest and easiest road to New-York; and will undoubtedly command a considerable part of their intercourse with the country South of Connecticut.

Saturday October 18, 1796, we rode from Taunton to Providence through the skirts of Rehoboth, and Attleborough, and through North-Providence, twenty miles. The road is tolerably good to Pawtucket river; and thence to Providence, four miles,

is intolerably bad ; being a deep sand, very heavy, and most uncomfortably set with stones of a considerable size.

Attleborough is a township, distributed almost wholly into plantations, with only a small village around the first church. It includes two parishes ; and two Presbyterian, and two Baptist congregations. The surface is moderately undulating, and the soil tolerably good. Providence furnishes it with a market for every thing, which the inhabitants have for sale. In 1790, the number of dwelling-houses was 314, and of inhabitants, 2,166. In 1800, they amounted to 2,480 ; and, in 1810, to 2,716.

The Rev. Habijah Weld was born at Dunstable, (Massachusetts) September 2, 1702 ; received the degree of A. B. in Harvard College, in 1723 ; and was ordained pastor of the first church and congregation in Attleborough, October 1st, 1727. He died, May 14th, 1782, in the 80th year of his age, and the 55th of his Ministry. The following account of this gentleman I received from the Hon. Mr. D. a Senator of the United States ; who was born, and during the period of childhood educated, in his near neighbourhood.

Mr. Weld was below the middle stature ; and in the latter part of his life, corpulent. His constitution was vigorous ; and his mind, almost singularly energetic. The stipend, which he received from his parishioners consisted of an annual salary of two hundred and twenty dollars ; and the use of a parsonage lot, which furnished him with wood, and a little pasture. With his patrimony he purchased a farm of about seventy acres, of moderately good land, and a decent house. He had fifteen children ; ten of whom were married during his life, and one after his death. The remaining four died while young. This numerous family he educated with the means, which have been mentioned, in a manner, superiour to what is usually found in similar circumstances ; entertained much company in a style of genuine hospitality ; and was always prepared to contribute to the necessities of others.

For the regulation of his domestic concerns, Mr. Weld prescribed to himself and his family, a fixed system of rules ; which were invariably observed, and contributed not a little to the

pleasantness and prosperity of his life. His children, labourers, and servants, submitted to them with cheerfulness; and his house became the seat of absolute industry, peace, and good order. Breakfast was on the table precisely at six o'clock; dinner, at twelve; and supper, at six in the evening. After supper he neither made visits himself, nor permitted any of his family to make them.

His observation of the Sabbath was probably unexampled. When hired labourers were at work for him, however busy the season, even when his crops were exposed to destruction by rain, he dismissed them all so early on Saturday afternoon, as to enable them to reach their own homes before sunset: the time, when he began the Sabbath. His cattle were all fed; his cows milked; the vegetables for the ensuing day prepared; and his family summoned together; previously to this sacred period. Until nine o'clock he spent the evening with his household in reading, and prayer; and at this moment they uniformly retired to their beds. No room in his house was swept; no bed was made; nor was any act, except such as were acts of necessity and mercy in the strict sense, done; until sunset on the succeeding day; when in his opinion the Sabbath terminated.

Mr. Weld was naturally of a very ardent disposition. Yet so entirely had he acquired an ascendancy over his temper, that a censurable, or imprudent, act, is not known to have been done by him, nor an improper word uttered. To vice and licentiousness, in every form, he gave no indulgence, either in his conversation, or his public instructions. On the contrary, idleness, intemperance, profaneness, and all kinds of immoral conduct, were reproved by him with undeviating severity. His example in the practice of every virtue was such, as to create in all classes of men entire veneration for his character. It is doubted whether any person ever uttered a reproach against Mr. Weld.

Nor was his piety less remarkable. Since the days of the Apostles, it is questioned whether his zeal, fidelity, and intrepidity, in the cause of his divine Master have been excelled. During the long period of fifty-five years, he was never once detained from

the pulpit by disease, nor from any other of his pastoral duties. His prayers were wholly formed by himself; and adapted with strict propriety to the various occasions, on which they were made. They were pertinent, solemn, and impressive. His sermons were written, and were usually delivered without variation from his notes. Yet at times he addressed his congregation extemporaneously in a manner eminently forcible and affecting. The doctrines, which he received, were those of the Reformation; those of the ancestors of New-England, which you will find recited in a subsequent part of these letters; and in communicating them he made no compromise with what he esteemed error. As he regarded the Scriptures with profound reverence, so he taught the truths, which he believed them to contain, in a manner undaunted, and unwarping. With the same spirit he reprov'd vice of every kind. Not a riot, not a serious violation of order, not a scene of dissipation, whenever any thing of this nature existed among his parishioners, escap'd his rebukes from the desk. Indecency in the house of God was never tolerat'd by him for a moment. If any member of his congregation slept during divine service, he was sure to be roused by a pungent reproof.

In his parochial visits he was accustomed to address the truths, and duties, of the Gospel to the hearts, and consciences, of the family; and never lost sight of the eternal interests of his congregation. And, while he administered the balm of life to the wounded spirit, he address'd the most solemn alarms, as well as the most pungent reproofs, to stubbornness, and impiety.

Mr. Weld continued his labours to the Sabbath, before his death, without any visible decline in his powers, either of body or mind. On that Sabbath he preach'd two sermons from these words: "He that believeth, and is baptis'd, shall be saved; and he that believeth not shall be damn'd." On the Tuesday following he rode in his chaise to Providence; ten miles; return'd about four o'clock in the afternoon; walk'd into the house; told his wife, that he was unwell; request'd her to open a window, as he found a difficulty in breathing; sat down; and instantly expir'd, of an Apoplexy. So well were his secular concerns arrang-

ged for his departure, that the settlement of his estate cost less than five dollars. His excellent wife survived him many years; and died after she had passed the age of ninety, universally lamented.

At the death of Mr. Weld, only one of his congregation was living, of those who assisted in his settlement. His parishioners shewed their sense of the loss, which they sustained in his death, by an universal mourning.

The house of this gentleman was the resort of many distinguished persons, from Boston, Providence, and various other parts of New-England; and in no house were they received, and treated, with more hospitality. His manners were at once dignified, and polite; and every member of his family was courteous and well bred. Nothing was seen among them but harmony and good will.

That with such an income Mr. Weld could support so large a family, and live in so hospitable a manner, will certainly excite not a little wonder. The explanation is found in his industry, regularity, and exactness, in all his concerns. Every thing was managed in such a manner, that almost in the literal sense nothing was lost.

“In my opinion,” adds Mr. D. “Mr. Weld was a more strict observer of the divine law, and more eminently holy, than any man, whom I ever knew.”

Permit me to subjoin, that if all Clergymen sustained the same character, and lived in the same manner, the world would speedily assume a new aspect, and its inhabitants, a new character.

Before we reached Providence, we crossed Seekonk plain: an absolute level, about five miles in length, and three and a half in breadth. This spot has for a long time been a favourite scene of the Rhode-Island horse races; and more than any other ground within my knowledge resembles Hempstead plain on Long-Island; devoted from an early period to the same miserable employment.

Rehoboth is a large farming town, bounded on the South by the State of Rhode-Island, and on the North by Attleborough. Its

surface to a great extent is level, but interspersed with hills of a moderate elevation. Its soil is tolerably fertile.

This township was settled in 1644 by a colony from Weymouth, under the conduct of the Rev. Samuel Newman. It was incorporated in 1645.

The country from Bridgewater to Providence, perhaps thirty miles in breadth, was to a great extent the seat of Philip's immediate hostilities. In Rehoboth the Indians burnt on the 28th of March, 1676, about forty houses, and thirty barns; and in Providence, soon after, about thirty houses. On the 8th of the following May they burnt about seventeen houses and barns in Bridgewater. Not long after they killed four of the inhabitants of Taunton. The preceding year, also, many outrages were committed both upon Taunton, and Bridgewater; and in the months of April and May, there were burnt in Bridgewater thirteen houses, and several barns.

Philip had declared, that the people of Taunton, and Bridgewater, should be the last to be destroyed. On the 11th of July, 1676, he assembled all the warriors, whom he was able to collect, and marched to Taunton, with a design to accomplish its destruction. Raynham was at this time, and for many years after, a parish of Taunton; and was undoubtedly to be included in the common ruin. A black man, who understood the language of the savages, and had been taken prisoner by Philip's people, discovering his intention against the inhabitants of Taunton, made his escape, and acquainted them with their danger. They accordingly prepared themselves to give him a warm reception; and, with the aid of some soldiers in their neighbourhood, saluted him with such spirit, that, after having set two houses on fire, he retreated. Captain Church, afterwards Colonel Church, the commander of the Plymouth forces, and one of the most celebrated partisans in the New-England history, attacked him speedily after; defeated him in several successive engagements; and killed, and took, a considerable part of his men. At length he fled to a swamp in the neighbourhood of Mount Hope, in Bristol, (R. I.) Captain Church, being informed of this fact, pursued him; but

scarcely had he reached the ground, when Philip was shot by one of his own countrymen.

In 1790, Rehoboth contained 688 houses, and 4,710 inhabitants: in 1800, the number of inhabitants was 4,743, and in 1810, 4,866. The Indian name of Rehoboth was Seconnet. It includes one Presbyterian, and five Baptist Congregations.

The two last-mentioned townships are improving. The near neighbourhood of Providence furnishes the inhabitants with a ready market for all their produce; and stimulates them to industrious exertion.

In the North-Western corner of Rehoboth there is a compact, and neat, settlement on the Pawtucket, or Providence river. This, with another on the Western bank, form what is called North Providence: although this name in strict propriety belongs only to the latter. This village is well-built; and wears a flourishing aspect. The river is a large mill-stream; and just below the village becomes navigable for boats. Directly under the bridge commences a romantic fall, which, extending obliquely down the river, furnishes a number of excellent mill-seats. Of this advantage the inhabitants have availed themselves. There is probably no spot in New-England, of the same extent, in which the same quantity, or variety, of manufacturing business is carried on.\* In the year 1796, there were here

3 Anchor-forges,  
1 Fanning Mill,  
1 Flouring Mill,  
1 Slitting Mill,  
3 Snuff Mills,  
1 Oil Mill,  
3 Fulling Mills,  
1 Clothier's Works,

1 Cotton Manufactory,  
2 Machines for cutting nails,  
1 Furnace for casting hollow ware; all moved by water,  
1 Machine for cutting screws, moved by a horse,  
And several forges for smiths' work.

The whole descent of the river is said to be fifty feet. The principal fall is about thirty. The mass of rocks, by which it is produced, is thrown together in the wildest confusion. When we passed this place, the river was low. In 1807, while crossing

\* 1810.

the ferry, just below, in an oblique direction near a mile in extent, during almost the whole of which it was visible, I had a remarkably fine view of this cataract. The river was full; and fell in a circuitous extent of little less than two hundred feet, and in a great variety of forms of wildness and grandeur.

Most of the manufactures at this place have been carried on successfully. The number of workmen employed, the number of buildings, and the mass of capital, have therefore continually increased. But in the year 1806, the deluge of rain which fell in the beginning of February, raised the river to an unprecedented height; and swept away in a moment the laborious efforts of many years.

North-Providence was formerly a part of Providence. In 1790 it contained 1,071 inhabitants. In 1800, 1,067. And in 1810, 1,758.

I am, Sir, yours, &c.

## LETTER LI.

Providence—College—Public Buildings—Major General Greene—Commerce of Providence.

*Dear Sir,*

**THE settlement of Providence, the largest town in the state of Rhode-Island, was begun by Roger Williams, heretofore mentioned, in 1636. Soon after, it became the general resort of such adventurers, as were disaffected with the Massachusetts government; and in a short time, the plantation, as it was called, became considerable. Mr. Williams was held in high veneration by all the inhabitants, and regarded as their common father.**

Providence is built on the Western side of Pawtucket river, in two divisions; one on the Eastern, and the other on the Western side of a cove, which is an arm of that river. The site of the Western division is a slope, gradually rising from the cove; that of the Eastern is the narrow base, and the side, of a lofty hill, which runs between the cove and the river to the point of their junction. The two principal streets on the Eastern side, pass, one at the bottom, and the other at a little distance along the side, of this hill, until they terminate at the river. The principal street on the Western side is a part of the great road towards New-London and Hartford. Those, on the East, are crossed by several others nearly at right angles.

Many of the houses in this town are ancient, and ordinary; many more are modern buildings, and would be called good houses in a New-England village; although inferiour to a multitude of houses in such villages. A small number are of a character superiour to this: and three or four are splendid.\*

\*Since this was written, a great number of good houses have been built in Providence, of which a considerable proportion may be justly styled elegant. Two new churches, an Episcopal, and a Presbyterian, both honourable to the inhabitants, have been lately erected. Few towns in New-England have been more improved in their appearance.

The public buildings in Providence, are a College; three Presbyterian, one Episcopal, and two Baptist Churches: a Friends' meeting-house; a court-house; a gaol; a work-house; and a market.

The College stands on the summit of the hill: and is a brick building of four stories, one hundred and fifty feet in length, and forty-six in breadth. A projection in the centre, of twenty feet on each side, enlarges the breadth here to eighty-six feet; and contains the public rooms. The rest of the building consists of rooms, and studies designed for the students. It overlooks every part of the town; the cove, and the country beyond it; the river with the regions on both sides; together with extensive tracts to the North, and East. The prospect is noble; but is sensibly impaired by the sterility of the soil in the Western quarter; and is not a little deficient in fine varieties of surface.

The Faculty of this College is composed of a President, Professors of Natural Philosophy, of Mathematics and Astronomy, of Theology, of Moral Philosophy and Metaphysics, of Oratory and Belles Lettres, of Law and of Chemistry, and three Tutors.

The Corporation is composed of two boards: one of Fellows; the other of Trustees. The former consists of twelve, including the president: of whom eight are required by the charter to be Baptists. The latter consists of thirty-six: of whom twenty-two must be Baptists; five Quakers, five Episcopalians, and four Congregationalists. This Institution was established in 1764; and was originally stationed at Warren; where the first commencement was held in 1769. The next year it was removed to Providence. Its legal name is now *Brown University*: given it in honour of Nicholas Brown, Esq. who has been its most liberal benefactor. This Seminary possesses a library of about three thousand volumes; a philosophical apparatus; and a museum, containing a number of natural and artificial curiosities. Both its internal and external concerns are considered as prosperous. The whole number of students graduated to the year 1817 was eight hundred and twenty-nine, of whom seven hundred and fifteen were then living. The whole number of ministers among the

alumni was one hundred and forty-nine, of whom one hundred and thirty were then living. The number of students is from one hundred and twenty to one hundred and thirty.

The Baptist church is a very good building, with an uncommonly handsome steeple : too high, however, for the body of the Church. Its situation is disadvantageous : the hill, before mentioned, rising suddenly behind it, and making it appear lower than it really is.

The Presbyterian church on High-street is located with taste ; and, both within and without, is one of the handsomest churches in New-England. It is fronted with two towers ; each crowned with a well appearing cupola.\*

A short time before our arival at Providence, this building furnished a remarkable instance of the efficacy of sound. While it was unfinished, a bird flew into it ; and in endeavouring to escape directed his course to a sky-light in the dome, over the centre of the house. As he was fluttering around the sky-light, one of the workmen on the floor struck with his hammer a smart blow upon a work-bench. The bird instantly dropped ; and was taken up dead. Whether he was killed by the sound, or by the fall, cannot, perhaps, be determined.

The Court-House is a decent building.

The morals of Providence are probably superiour to those of any other town in this State. The usual order of things, with respect to morality, seems here to be inverted. In most other States the country is more virtuous than the city. Here, a general, and honourable, regard to morality, and a general performance of its duties, such as is found in other respectable towns of this country, appears to prevail. Many years have not elapsed since the market, the street, and the wharves, were little less frequented on the Sabbath, than on other days. You will remember, that the Sabbath in this state is neither regarded by the laws, nor sanctioned by any general religious observance. We saw a few carts entering the town ; but were informed, that the num-

\* In the year 1814, this church was consumed by fire.

ber had yearly decreased for a considerable time, and that the inhabitants were strongly, as well as generally opposed to this indecent intrusion.

Of Providence the Hon. Nathaniel Greene, a Major-General in the army of the United States, and during the latter part of the revolutionary war Commander in Chief of the army in the Southern States, was a citizen. This gentleman was born at Warwick in the year 1740. His parents were of the sect of Friends. In early life he was fond of study, and reflection; and particularly attached to the history of military transactions. In Providence he established himself as a merchant; and acquired a distinguished character in the estimation of his fellow-citizens. After the battle of Lexington, he went as a Brigadier-General, at the head of three regiments, to Cambridge; and was of course discarded by the Friends. In August 1776, he was raised to the rank of Major-General; and very honourably distinguished himself in the following December, and January, by his gallant behaviour in the battles of Trenton, and Princeton: as he did the succeeding year at the battle of Germantown. In March 1778, he accepted the place of Quarter-Master-General, on the condition of retaining his rank, and his command during the periods of action. This year he signalized himself, June 28th, at the battle of Monmouth, and in the action on Rhode-Island the following August.

After the defeat of General Gates at Camden, August 16th, 1780, he was appointed to the chief command of the military force in the Southern States. Upon this command he entered in circumstances, which would have discouraged almost any other man. After the miserable defeat above mentioned, that part of the country was, in a sense, overrun by the British. Multitudes of the inhabitants had already joined the enemy. Multitudes more were on the point of following their example. The rest, though sufficiently firm and resolute, were continually wounded by the defection of their neighbours, and perpetually in fear of the ravages of invasion. Colonel Williams had, indeed, with the aid of his generous companions, Tracey, Banan, Campbell, Shelby, and Cleveland, checked the progress of the enemy by the gallant ac-

tion at King's mountain: as had General Sumpter by two honourable efforts at Broad and Tiger rivers. But their force was too small to obstruct, in any serious degree, a well-appointed and victorious army, commanded by officers of distinguished talents.

In these circumstances General Greene commenced the arduous business of recovering this country from the British. At his arrival, he found himself at the head of 3,000 men, including 1,200 militia. These he divided; and sent one part under Brigadier-General Morgan into the district of Ninety-six: the other he himself led to Hicks's Creek, on the North side of the Pedee. Morgan was attacked by Lieutenant-Colonel Tarlton, a brave and skilful partisan, at the head of a superiour force. But he repulsed the attack; and gained a complete victory. Lord Cornwallis, with the whole British army, pursued Morgan's detachment; at the head of which General Greene, after a rapid journey, placed himself, and conducted it with such felicity, and success, as to reach the main body, in spite of one of the most vigorous pursuits recorded in history. He was, however, still pursued with the same celerity, until he arrived in Virginia: but he completely eluded the vigilance of the enemy. The moment the pursuit ceased, having received a reinforcement, he marched after Lord Cornwallis; and gave him battle at Guilford Court-House, now Martindale. Victory declared for the British; but cost them so dear, as to produce all the consequences of a defeat. Lord Cornwallis retreated. Greene, immediately following him, and finding that he was directing his course to Virginia, returned to South-Carolina; and marched at the head of about 1,100 men, within a mile of Camden, then defended by Lord Rawdon with 900 men. The British commander attacked him. He was again defeated; but with so little advantage to the victors, that his lordship found himself obliged to burn a considerable part of his baggage, and to retire to the South side of the Santee. Greene, in the mean time, directed his several detachments with such skill; and the highly meritorious officers, by whom they were led, employed them with such activity and gallantry; that a great part of the British posts in Carolina, and Georgia, were rapidly retaken; and a con-

siderable number of the troops, by which they were defended, made prisoners. He then made an unsuccessful attempt on the post at Ninety-Six; and was obliged to raise the siege by the approach of Lord Rawdon. He next moved his force to the South side of the Congaree. The British, having collected theirs, passed that river also; and took post at the Eutaw springs, on the South side of the Santee. Here Greene determined to attack them in their encampment; and the consequence of his attack was a victory, which ended the war in this part of the Union. General Greene took the command of the Southern troops near the close of the year 1780. The battle of the Cowpens was fought on January 17th; and that of the Eutaw springs on the 6th of September following. The troops under his command were chiefly new-raised, half armed, half clothed, and often half fed. They were however brave, determined men; and wanted nothing, but the usual advantages of war, to meet any soldiers in equal numbers, on fair ground. Within nine months, therefore, did this illustrious man, aided by a band of gallant officers, recover with these troops the three Southern States from a veteran army of superior force, commanded by officers of great merit, and furnished with every accommodation. The country he found in a state of extreme suffering and despondency. His progress through it was a source of perpetual personal hardship, intense labour, and unremitting anxiety. Seven months was he in the field, without taking off his clothes, even for a single night. At times he was obliged to ask bread of his own soldiers; themselves miserably supplied with food. Yet he never desponded. "Nil desperandum" was the motto of his military life. The very letters, which conveyed to Congress, and to General Washington, accounts of the difficulties with which he struggled, contain, also, proofs of his invincible fortitude, and resolution. When he was advised, after he had retreated from Ninety Six, to retire into Virginia; he answered, "I will recover South-Carolina, or die."

With this gentleman I was well acquainted. His person was above the middle stature, well formed, and invested with uncommon dignity. His eye was singularly keen, and intelligent. His

mind, possessed of vast resources, was bold in conceiving, instantaneous in discerning, comprehensive in its grasp, and decisive in its determinations. His disposition was frank, sincere, amiable, and honourable : and his manners were easy, pleasant, affable, and dignified. Seldom has the world witnessed superiour respectability.

This great man died June 19th, 1786, at his own house in Georgia, when he had commenced his 47th year. Having walked for some time in an intensely hot day, he was smitten with what is called a *stroke of the sun* ; and lost his life, not improbably by neglecting to carry an umbrella. He had removed to that country, to cultivate a plantation, presented to him by the Legislature as a testimony of its gratitude for services, so honourable in themselves, and so important to its inhabitants.

Providence was settled, as I have observed, in the year 1636. It was purchased by Roger Williams of Miantonimoh, and Canonicus ; and by him and several of his friends, the plantation was begun. In 1640, they adopted a form of government. In 1645, or 1646, the number of men, able to bear arms, was about one hundred. They lived in peace with the Indians until the great war with the Narrhagansetts in 1676 ; when these savages invaded the town, and burnt about thirty dwelling houses. This seems to have been the only instance in which the inhabitants suffered, materially, from Indian incursions. Fifty-four years afterwards, the white inhabitants of Providence, then including Providence, North Providence, Smithfield, Gloucester, and Scituate, amounted to 3,707.

In the year 1790, there were on the same ground 16,962 persons ; and, in 1800, 18,333 ; and in 1810, 20,535.

The present town of Providence contained in 1790, 6,380 inhabitants ; in 1800, 7,614, and, in 1810, 10,071.

Providence is the third town in New-England, in its population and commerce, and probably the first as to manufactures. The inhabitants, like those of Salem, have been obliged to combat many disadvantages, but in the end have surmounted them with a spirit of industry, enterprise, and perseverance, rarely displayed.

The country around them, particularly in their own State, is generally so lean, as scarcely to supply its inhabitants with food. But the merchants by their activity and prudence have engrossed, to a considerable extent, the custom, and produce, of the neighbouring regions of Massachusetts, and Connecticut. They have, also, engaged in several kinds of manufactures with a spirit, and success, unrivalled in this country.

The following abstract of duties will exhibit a partial view of the imports of this town.

## LETTER LII.

Rhode-Island Turnpikes—Johnstown—Scituate—Coventry—Sterling—Plainfield.

*Dear Sir,*

WE left Providence, Monday October 20th, and crossing the state of Rhode-Island through the towns of Johnstown, Scituate, and Coventry, entered Connecticut at Sterling, and rode to Plainfield: thirty miles. The road after leaving Providence lay for two or three miles on a pine plain; and was tolerably good. It then became stony, and ill, or rather not at all, repaired. After dragging uneasily over several tedious miles, we came to a road, begun in the turnpike manner, and tolerably well made; which lasted, though not without several interruptions, ten or twelve miles. The former disagreeableness of the road was here renewed; and we proceeded with sufficient difficulty, till we came to Sterling; where we were again relieved by a turnpike road. The country between Providence and Sterling is a succession of hills and vallies, running North and South. The hills are of considerable height, and incumbered, as the vallies are also, with a multitude of rocks and stones.

The people of Providence expended upon this road, as we are informed, the whole sum permitted by the legislature. This was sufficient to make only those parts, which I have mentioned. The turnpike company then applied to the legislature for leave to expend such an additional sum, as would complete the work. The legislature refused. The principal reason for the refusal, as alleged by one of the members, it is said was the following: that turnpikes, and the establishment of religious worship, had their origin in Great Britain: the government of which was a monarchy, and the inhabitants slaves; that the people of Massachusetts and Connecticut were obliged by law to support ministers, and pay the fare of turnpikes, and were therefore slaves also; that, if they chose to be slaves, they undoubtedly had a right to their choice; but that free born Rhode-Islanders ought never to

submit to be priest-ridden, nor to pay for the privilege of travelling on the highway. This demonstrative reasoning prevailed; and the road continued in the state, which I have mentioned, until the year 1805. It was then completed; and free born Rhode-Islanders bowed their necks to the slavery of travelling on a good road. The soil of this tract is usually lean; and the prospects are destitute of beauty. The townships are as thickly settled, probably, as they will ever be, unless by means of a new state of society, and a new mode of cultivation. The houses are almost all very poor, and ill repaired. Two or three small buildings, resembling miserable barns, were seen on the road, which we were informed were Baptist churches; and not more than perhaps half a dozen dwelling houses, between the environs of Providence and Sterling, of those which were visible to us, could be termed decent. The cultivation of this country, is of a piece with every thing else, which it presents to the eye; and exhibits very few proofs either of skill or success. The whole tract is a collection of thinly scattered settlements, without a village, or even a hamlet. We found, however, a good inn in Scituate.

	<i>Inhabitants.</i> contained in 1790		<i>Inhabitants.</i> in 1800		<i>Inhabitants.</i> in 1810
Johnston,	1,320	- -	1,364	- -	1,516
Scituate,	2,315	- -	2,523	- -	2,568
Coventry,	2,477	- -	2,423	- -	2,928

At Sterling, we were pleasantly advertised, that we had entered the State of Connecticut by the sight of a village, with a decent church and school-house in its centre, and by the appearance of comfortable dwellings, and better agriculture. The country was rough, here also; but it wore the appearance of having been dressed. Every thing looked, as if the activity of man had been successfully, as well as diligently, employed to render life easy and desirable. From the hill, on which Sterling is built, we had, after we begun our descent, a very rich and extensive prospect of the country along the Quinibaug; one of the most fertile and beautiful tracts in New-England. Sterling was formerly a part of Voluntown. In 1800 it contained 908 inhabitants; in

1810, 1,101. Voluntown contained, in 1756, 1,029 whites, and 29 blacks; in 1800, both these towns contained 2,037 persons: and, in 1810, 2,117.

Plainfield is a beautiful township lying along the Quinibaug. It is formed partly of a considerable plain, bordering that river, and partly of the Western declivity of those handsome hills, by which the valley of the Quinibaug is limited on the East. The soil is generally good; and the surface, pleasant. The plain, indeed, has for some years been considered as in a great measure exhausted. But the inhabitants are now beginning to cultivate it with gypsum, and with considerable success. The town of Plainfield is principally built on a long street, running North and South; and, although the houses rise only to the style of decency, makes a pleasant appearance to the eye.

In the autumn of 1805, and in that of 1807, I passed through this country.

Providence itself had increased in the beauty of its appearance. The tract between that town and Sterling had scarcely changed at all. Sterling had advanced in a moderate degree, and Plainfield was greatly improved. Many of the buildings were repaired, and beautified; and several new ones added materially to its appearance.

There is a respectable Academy in Plainfield, which has generally been under the superintendence of excellent instructors. With little assistance from funds, it has been usually in a prosperous condition; and has sent out many excellent scholars to the New-England Colleges.

In 1756 Plainfield contained 1,800 inhabitants; in 1774, 1,562; in 1800, 1,619; and, in 1810, 1,738. In 1756, the number of slaves was 49; in 1774, 83; in 1800, none. Whether any part of this township has been taken off since the first of these enumerations I am ignorant. If there has not, I suspect there is an error in the number.

Plainfield contains two congregations; a Presbyterian, and a Baptist: Sterling one; a Presbyterian.

I am, Sir, yours, &c,

## LETTER LIII.

Preston—Lisbon—The Shetucket—Quinibaug, and Thames Rivers—Norwich—  
Gov. Huntington.

*Dear Sir,*

TUESDAY morning, October 21st, we proceeded on our journey through Plainfield; and, passing through a corner of Preston, and a part of Lisbon, we arrived at Norwich before dinner.

Of Preston we saw nothing, except a skirt of the township, and a little village, called Jewett's city; consisting of a few well-appearing houses on the Eastern bank of the Quinibaug.

I forgot to observe, that Plainfield was purchased, together with Canterbury, in 1659, by Governor Winthrop. Twenty years afterwards it was settled by some planters from Chelmsford in Massachusetts; and was incorporated in 1699.

Preston is a considerable township of valuable land, bounded Northward by Plainfield, Westward by the Quinibaug, Southward by Groton, and a part of North-Stonington, and Eastward by a part of North-Stonington, and by Voluntown. It contains three Presbyterian, one Independent, and one Baptist, Congregations. In 1756, the number of its inhabitants was 2,018; slaves 78. In 1774, it was 2,338; slaves 83: in 1800, 3,440; slaves 5: in 1810, 3,284. Lisbon was formerly a part of Norwich. This is an excellent township: the soil being here, as in most of the region on the Quinibaug, the reddish loam, heretofore mentioned; but less mixed with clay. Naturally it is suited to every production of the climate; but is said, for some time past, to have been less favourable to wheat than formerly. The reason is probably that, which I mentioned in my observations concerning the County of Worcester. Our journey lay along the Eastern border of this township. Here it was a succession of hills and valleys, on which are interspersed fine groves of tall and beautiful trees. One of these eminences named Bundy Hill is sufficiently difficult, to make a humane traveller feel for his horses. The whole region

between Plainfield and Norwich, except the little village mentioned above, is a collection of farms, cultivated by inhabitants, generally in easy circumstances.

Lisbon includes two parishes; and contained in 1800, 1,150 inhabitants; and in 1810, 1,128.

That part of the township of Norwich, through which we passed, is much inferior to Lisbon, both in the fertility of its soil, and the beauty of its surface. The town-plat is principally a valley; rather smooth and pleasant, but bordered by rude hills, and on the West by rugged precipices, which abut disagreeably upon the gardens, and in some instances almost upon buildings.

Norwich lies upon three rivers, which have their confluence within its bounds: the Little river or Yantic, Shetucket, and Quinibaug. The first of these has its sources in Lebanon, and Colchester. It is a valuable mill-stream; and about a mile above its mouth, falls very romantically, over a confused mass of granite. Colonel Trumbull was so well pleased with this spot, that he took, a few years since, three beautiful views of as many different scenes, which it furnishes.

The principal branches of the Shetucket have their sources in Stafford, Tolland, and Union. These unite in the South-Western corner of Windham: whence the common stream proceeds along the Southern skirt of that township; and then, forming the boundary between Lisbon on the East, and Franklin and Norwich on the West, unites with the Quinibaug just above the city of Norwich. This river, having its sources in a country, formed of high hills, (the Lyme range,) is subject to sudden and violent freshets; and frequently ravages its banks with great fury, and not a little devastation.

The river, which empties its waters into the Sound at New-London, is more unhappily named, than any other. Hop, Willimantic, Fonton's, Mount Hope, and Bigelow's, rivers, uniting in Windham, form the Shetucket. After this river unites with the Quinibaug, the common stream bears the name of Shetucket, until it reaches the point, on which Chelsea is built; here customarily called Norwich Landing. From this point to the ocean it is nam-

ed the Thames. To remove this misnomer, I would call *the Quinibaug*, the longest and noblest of these branches, *the Thames*: and, if propriety be permitted to influence, I am sure of being followed by my countrymen. Now, a stranger, conversing with the inhabitants of this region concerning the Thames, and its branches, can neither understand them, nor be understood by them.\*

Norwich contains two parishes; the Town, and Chelsea; and four congregations: two Presbyterian, one Episcopal, and a Baptist. The centres of these parishes are distant from each other about two miles: but the buildings of both are extended to the dividing line. The ends are spread out, and populous: the middle is a single chain of houses. The town contains a considerable number of good, ancient houses; together with a number, not small, of those which are decayed. Chelsea is built more in the modern style; and generally exhibits a sprightlier and better appearance. There is also a settlement above the town, consisting principally of farmers, and included in the first parish. The two parishes are supposed to contain upwards of 500 houses. Half of the courts in the County of New-London are holden here. The Court-House is not remarkable for its beauty. The Presbyterian churches are good structures. Nothing can be more irregular than the manner, in which this town is built. Chelsea, particularly, is a high, steep and rocky point; encompassed by a margin, scarcely wide enough to admit two rows of houses. The inhabitants have been obliged, in many instances, to level spots for their buildings, before they could lay the foundations. The plain between Chelsea, and the town, is, however, beautiful ground.

This city, besides the usual parochial schools, has an Academy, and another school supported by funds. Its religious and moral interests, are, as I believe, nearly on the same level with, those of the ancient settlements, in New-England generally; perhaps a little above that level.

The government of Norwich is vested in a Mayor, Aldermen, and Common Council.

\* When a child, I had similar perplexities about the *Trent* and the *Humber*.

The inhabitants of this town were formerly distinguished beyond any other in the State for the variety, and abundance, of their manufactures: while at the same time they carried on a prosperous commerce. Within the last twenty years their trade has suffered severely from several causes; particularly from fires, and French depredations. From the latter source no town within my knowledge has experienced greater losses, in proportion to its trading capital. Its commerce however is still considerable: and Chelsea has lately increased much in its buildings, and population. At a future day it must, I think, be one of the three most commercial places in Connecticut. For a great part of the Eastern division of the State it must ever be the most convenient port: and there are now turnpike roads, branching to it from almost every town in this region.

Norwich has always been the residence of many respectable inhabitants. The names of Huntington and Lathrop have long been distinguished. The late Governor Huntington deserves to be particularly mentioned. This gentleman was originally a lawyer; and in this character rose to high estimation. In public life he sustained the offices of representative, councillor, member of the old congress, President of the same, Chief justice of the State, Lieutenant-Governor, and Governor. All these offices he filled usefully, and honourably; and died in the gubernatorial chair. With this gentleman I was intimately acquainted; and revere his memory for his candour, moderation, wisdom, integrity, patriotism and piety. It ought to be observed that he rose to this respectability without the advantages of a liberal education.

In the year 1756, Norwich, including Lisbon, Franklin and Bozrah, contained 5,540 inhabitants: slaves 223: and, in 1774, 7,327: slaves 295. Within the same limits, there were in 1800, 6,778 inhabitants: slaves twenty.

The present Norwich contained in 1800, 3,476; in 1810, 3,528.

I am, Sir, yours, &c.

## LETTER LIV.

Montville—Mohegan Tribe of Indians—Uncas the chief Sachem—Return.

*Dear Sir,*

WEDNESDAY morning, October 22d we left Norwich; and proceeded through the skirt of Montville to New-London: twelve miles. The road is a turnpike: the first which was made in the United States. The former road was perfectly fitted to force upon the public mind the utility of turnpike roads. As New-London is the Port of entry for Norwich, the merchants of Norwich must often visit it upon business; and the convenience of despatch in cases of business I need not explain. Yet few persons formerly attempted to go from one of these places to the other, and return, on the same day. Pleasure-carriages on this road were scarcely used at all. The new road is smooth, and good: and the journey is now easily performed in little more than two hours. These towns, therefore may be regarded as having been brought nearer to each other more than half a days journey. The views, here presented to the traveller, are frequently pleasant.

The township of Montville is a collection of hills and vallies, cultivated by substantial farmers. The soil is good; and liberally rewards the labour of the husbandman. Montville consists wholly of plantations, and contained, in the year 1800, 2,233 inhabitants; and in the year 1810, 2,187.

Montville includes the principal *Mohegan Reservation*; that is, land, reserved by the State for the maintainance of this tribe of Indians. The number of these people, who were remaining in 1774, was, in Montville, 206. At the same time, there were in Stonington 237; in Groton 186; in Lyme 104; in Norwich 61; and in Preston 30: in all, 824. These, universally, may be considered as descended from those, who once owed some kind of allegiance to Uncas; an Indian chief not a little celebrated in the history of this country. The lands, owned by these people in Montville, are valuable; and of sufficient extent to yield them,

oderately good cultivation, a comfortable support. They are partly cultivated by themselves; and partly leased to the whites in the neighbourhood. From neither of these parts do they probably, derive any great advantage. Their agriculture is probably imperfect: and that of their neighbours is, I presume, more useful to themselves, than to the Indians. The concerns of these Indians have been long superintended with great uprightness and fidelity by the Hon. William Hillhouse, many years a Councillour of this State.

On our way we visited the spot where Uncas formerly lived. No place could have been pitched on with more felicity. It is a high point of land, commanding a noble and extensive view of the Thames, here a large river, and of the country on both sides. It was, therefore, well fitted for the discovery of an enemy's approach; and furnished every convenience to hostile excursions. At the same time it bordered on a never failing supply of provisions, furnished by the scale and shell fish, with which both the river, and the neighbouring ocean, have ever been richly stored.

Uncas was originally a petty Sachem; a Pequod by birth; a subject, and a tributary, to Sassacus. When the English made war upon the Pequods, Uncas was unfriendly to this chieftain; and would have quarrelled with him, had he not been kept in awe by the talents, and prowess, of this formidable warrior. Of the English he appears to have entertained, from the first, a very respectful opinion; and, when he saw them determined upon a war with his master, concluded to unite his forces, and his fortune, with theirs. His dread of Sassacus, was, however, so great, that when Captain Mason marched against the Pequods, he did not believe him to be serious in his professed design of attacking that terrible nation; nor did he ever engage in the conflict, until after Mason and his little band of heroes had stormed the Pequod fortress.

Upon the death of Sassacus, Uncas became the Sachem of the remaining Pequods, as well as of the Moheagans. In this character he claimed, perhaps rightfully enough, as there was no other

acknowledged heir, all the territory, which had been possessed by that tribe. This tract included almost the whole of the Eastern division of Connecticut, from the middle of the Lyme range. He understood his own interest too well to quarrel with the English; and had a sufficient share of cunning to support his claims with very plausible reasons. They were, therefore, generally allowed.

From this time he became one of the most formidable, and altogether the most prosperous, Indian chieftain in Southern New-England. Over his subjects he exercised a more efficacious and unresisted government, than perhaps was ever exercised by any other Sachem. Nor was his control confined to them; but extended, in a considerable degree, to several of the tribes on the Western side of the Connecticut. To his enemies he became scarcely less formidable, than Sassacus had been before him. At the head of four or five hundred men, he met Miantonomoh, a brave and sagacious Chief of the Narrhagansetts, coming to attack him with twice the number; and, after having in vain challenged him to single combat, defeated his army, took him prisoner, and put him to death. On this occasion he cut a piece of flesh from his shoulder; roasted and ate it; and with the true spirit of a savage declared, that it was the sweetest meat, which he had ever tasted in his life.

The avarice, ambition, and restlessness, of this man frequently embroiled him with his neighbours; and were sometimes troublesome to his English allies. The natives considered them as the friends of Uncas; and implicated them more or less in his mischievous conduct. When he found the English resentful, and himself severely censured; he made such submissions, promises, and presents, as he thought necessary to restore their good-will, and secure his future peace. But he was not indebted for these advantages to his address only. On several occasions he rendered them real and important assistance; and to their interests he adhered faithfully, and uniformly. No Indian among the New-England tribes, except Massasoit, exhibited an equally steady attachment to the Colonists, or so regular an adherence to his en-

gagements. Hence he enjoyed their public friendship, and the good-will of individuals among them, until the day of his death.

Throughout most of his life he was hostile to the Christian religion. At Wabquisset, or Wabbaquasset, (Woodstock,) he openly opposed the efforts of Mr. Elliot, and Major General Gookin, to christianize the Indians of that place. His agent, sent for this purpose, declared his Master's displeasure against their proceedings; and insisted, that the christianized Indians became less obedient to his government, and paid their tribute with less punctuality. Towards the close of his life, however, he appeared to think more favourably of Christianity.

Uncas died at an advanced age, in his own house; and left his power, and his property, to his Children. Onecho, his eldest son, commanded a party of Moheagans in a war, which the English carried on against the Narrhagansetts, in 1676. The family, however, soon declined in their importance by the general declension of their tribe, and the sale of their property to the English. A few years since, a man, descended from Uncas, came from North-Carolina, or Tennessee, where he is settled; and obtained permission of the Connecticut Legislature to sell his patrimonial share in this tract. This man had received a military commission from the British government; and, it is said, was well dressed, well informed, sensible, and gentlemanly in his deportment. He is probably the only respectable descendant of Uncas, now living.

The Moheagans have been repeatedly solicited by the Oneidas to sell their own lands, and plant themselves at Brothertown in the State of New-York, a township, given by the Oneidas to the Indians of Connecticut. A few of them have, I believe, complied. Generally, they are so attached to their native spot, so addicted to a lazy, sauntering life, and so secure of gaining an easy livelihood by fishing in the neighbouring waters, as to feel little inclination to remove. Indeed, their circumstances, unless they should become industrious farmers, would certainly be made worse by their removal: and, if they are willing to labour, the lands, which they here possess, would furnish them ample subsistence.

Thursday, October 24th, we left New-London; and, being detained half a day at the ferry by a violent wind, rode only to Saybrook: twenty miles. The next day we arrived, without any accident, at New-Haven: thirty-four miles: having travelled, including occasional excursions, seven hundred miles in the whole. The towns, which lie in this part of our route, I shall describe hereafter.

I am, &c.

# JOURNEY

TO THE

## WHITE MOUNTAINS.

---

### LETTER I.

North-Haven—Wallingford—Meriden—Berlin—Mount Lamentation—Manufacture of Tin Ware.

*Dear Sir,*

It was my intention, when I began the journey, of which I have already given you an account, to go to Portland: the principal town in the District of Maine. This intention was frustrated by the badness of the roads from Berwick onward. On the 18th September, 1797, I commenced another journey with the same design, in company with Mr. L. one of the Tutors of Yale College. Both of us wished, also, to examine the country along Connecticut river, and to visit the White Mountains; which rise in the upper parts of New-Hampshire, and are the highest hills in the American Union. Accordingly we directed our course to Lancaster; a recent settlement in that State, on the Eastern bank of the river, about two hundred and seventy miles North of New-Haven. Thence we proposed to proceed, through *the Notch of the White Mountains*, in the only road, which led from the West, to Portland. On the first day we proceeded to Berlin: twenty-six miles. Our road lay wholly in the valley, formed by the Middletown range on the East, and that of Mount Tom on the West; commencing at New-Haven, and terminating in the Connecticut Valley at Wethersfield and Hartford. This I have taken the liberty to call *the Valley of Berlin*. The first sixteen miles of it are principally sandy and heavy. The rest is over firm ground, and tolerably good. A better road has been projected to Hartford; and since this journey was taken, has been completed.

After leaving New-Haven, we crossed a corner of the township of Hamden ; or, as it ought to be written, Hampden. Thence we entered North-Haven.

North-Haven lies on both sides of Wallingford river ; and comprises the valley, and a part of the bordering hills. The soil of the valley is partly rich interval land, and more extensively sand, covered with a thin stratum of loam ; light, but warm ; and yielding tolerable crops of rye. Near the Northern limit of the township it is so light, as in two or three places, of small extent, to be blown into drifts. In these places it is absolutely barren. The soil of the hills is good : being the reddish loam, heretofore mentioned.

The inhabitants of North-Haven, living so near to New-Haven, and accustomed to carry every thing to that market, are in easy and thriving circumstances. The township is divided principally into scattered plantations. There is, however, a small village around the churches. The ancient houses are ill built, and decreasing. The modern ones are good farmers' houses, and increasing in their number.

There are two congregations in North-Haven : a Presbyterian, and an Episcopal. The latter is a *small plurality*, under the care of a neighbouring minister. The churches stand upon a square in the centre of the township. The Episcopal is without a steeple. The bell of the Presbyterian church is partly composed of a mass of virgin copper, weighing ninety pounds ; which some years since was found in Hamden, at the foot of Mount Carmel. North-Haven, as I formerly observed, was originally a part of New-Haven. In 1790, it contained 1,236 ; in 1800, 1,157 ; and, in 1810, 1,239 inhabitants.

Wallingford bounds North-Haven on the North ; and lies, also, on both sides of the river. The plain, here, is narrow. The intervals, and the hill country, richer and more extensive. The soil of the township, generally, is excellent : being the loam so often mentioned. The town of Wallingford is beautifully situated on a fine elevation ; a mile and a half East of the river : and consists principally of a single street, extending along the ridge of the hill, from a mile and a half to two miles.

Wallingford at the date of this journey, contained two parishes : Wallingford and Meriden. In Meriden there is a small neat village on a handsome eminence in the centre of the parish. The remainder of the township is distributed into farms.

There are four congregations in Wallingford : two Presbyterian, an Episcopal, and a Baptist. There are also four churches. The first Presbyterian church, only, has a steeple. The second Presbyterian congregation, since this journey was taken, has, I believe, united with the first. The Baptist church, but for some windows, half glazed, would be mistaken for a barn : and is, I think, the most indifferent building, consecrated to the worship of God; which I have ever seen in this State. All these congregations, except the first Presbyterian, are small.

Meriden contains two congregations and two churches : a Presbyterian, and an Episcopal, which is a plurality. This church, also, is without a steeple.

Wallingford was settled in 1670 ; and was originally called New-Haven Village. The inhabitants, although not without many respectable exceptions, are far from being distinguished by their attachment to learning. Within the fifteen years, preceding 1810, no native of this town has, within my knowledge, received a liberal education.

In Meriden, the business of manufacturing culinary utensils from tin plates has been considerably extended ; and is becoming a source of wealth to the inhabitants.

Fruit trees usually blossom here on the Southern declivity of the hills, and in the valley at the bottom, three or four days earlier than at New-Haven. In the year 1756, Wallingford contained 3,713 inhabitants ; in the year 1774, 4,777 ; of whom 134 were slaves. It then included Cheshire, a considerable township, lying immediately Westward of the Mount Tom range, in the valley of Farmington. In the year 1790, it contained 3,375 ; in 1800, 3,214. It then included Meriden, which has since been incorporated as a town. In the year 1810, Wallingford contained 2,325, and Meriden 1,249.

Berlin lies immediately North of Wallingford. Here the valley expands, at the Southern limit of the Township, from four to five miles; and, at the Northern, not less than eight; the Middletown range, which bounds it on the South, turning Eastward, and the range of Mount Tom diverging to the North. No township within my knowledge, which does not border upon the ocean, a lake, or a large river, is equally beautiful with this. It is composed, almost wholly, of a vast basin, studded with several fine eminences, and the acclivities, by which it is surrounded. On the South-Eastern side runs the Middletown range; on the North-Eastern, shooting out from it as a spur, a small ridge, called Newington Mountain; on the North-Western, the range of Mount Tom, at such a distance, as to leave a large opening to the North; and on the South-Western, a succession of rising grounds, extending over the breadth of the valley. In the Mount Tom range, beside the general chain, are seen in the South-Western point the noble bluffs of the Blue Mountains in Southington, at the distance of ten miles; Farmington Mountain, five; West Mountain, fifteen; and the peak of Mount Tom, forty-five. The basin itself is a scoop of singular elegance and beauty. The soil is of the richest kind; the groves thrifty; the vegetation luxuriant: and the interspersion of churches, houses, and fields delightful. In the Middletown range there is a handsome eminence on the South; called, from the following incident, Mount Lamentation. Mr. Chester, formerly a distinguished inhabitant of Wethersfield, lost himself, many years since, in the forests, with which this region was then covered. His fellow-citizens came out in a body, to search for him: but, after exploring the forests a considerable time, they gave over the search: concluding, that he was dead. From the lamentations, which they here made for the supposed, unhappy end of this respectable man, the mountain derived its name. He was, however, soon after found alive.

Berlin contains three parishes: Worthington on the East, Kensington on the West, and New-Britain on the North: neither of the parishes bearing the name of the township. This fact has, I suppose, arisen here, and elsewhere, from the fear, lest one of the

parishes should assume an aristocratical precedency. Worthington was so named, from respect to the Hon. John Worthington, LL. D. late of Springfield. This gentleman and two others were chosen, to divide the original parish of Kensington, comprehending at that time both the Southern parishes; and by his prudent, and persuasive, efforts to quiet their contentions recommended himself so much to the inhabitants, that they petitioned the Legislature to call the second parish by his name. Worthington is a handsome village, extending about a mile on the road, where it passes along a beautiful eminence. The houses in it are generally good, and the prospects superiour.

The inhabitants of this village make great quantities of *tin ware*; or utensils, formed of tinned plates. As this species of manufacture, on the Western side of the Atlantic, probably commenced here; I will give you an account of the manner, in which it was introduced.

About the year 1740, William Pattison, a native of Ireland, came to this country, and settled in this town. His trade was that of a tinner: and soon after his arrival, he commenced manufacturing tin ware, and continued in that business until the Revolutionary war. He was then under the necessity of suspending it, as the raw material could not be obtained. After the war, this manufacture was carried on at Berlin, by those young men who had learned the art from Mr. Pattison; and these persons have since extended the business over a number of the neighbouring towns.

For many years, after tinned plates were manufactured in this place into culinary vessels, the only method used by the pedlars for conveying them to distant towns, for sale, was by means of a horse and two baskets, balanced on his back. After the war, carts and waggons were used for this purpose, and have, from that time to the present, been the only means of conveyance which have been adopted.

The manner, in which this ware is disposed of, puts to flight all calculation. A young man is furnished by the proprietor with a horse, and a cart covered with a box, containing as many tin

vessels, as the horse can conveniently draw. This vehicle within a few years has, indeed, been frequently exchanged for a waggon; and then the load is doubled. Thus prepared, he sets out on an expedition for the winter. A multitude of these young men direct themselves to the Southern States; and in their excursions travel wherever they can find settlements. Each of them walks, and rides, alternately, through this vast distance, till he reaches Richmond, Newbern, Charleston, or Savannah; and usually carries with him to the place of his destination no small part of the gain, which he has acquired upon the road. Here he finds one or more workmen, who have been sent forward to co-operate with him, furnished with a sufficient quantity of tinned plates to supply him with all the ware, which he can sell during the season. With this he wanders into the interior country; calls at every door on his way; and with an address, and pertinacity, not easily resisted, compels no small number of the inhabitants to buy. At the commencement of summer they return to New-York; and thence to New-Haven, by water; after selling their vehicles, and their horses. The original load of a single horse, as I am told, is rarely worth more than three hundred dollars; or of a waggon, more than six hundred. Yet this business is said to yield both the owner and his agent valuable returns; and the profit to be greater than that, which is made by the sale of any other merchandize of equal value. Even those, who carry out a single load, and dispose of it in the neighbouring country, find their employment profitable. In this manner considerable wealth has been accumulated in Worthington, and in several towns in its vicinity.

Every inhabited part of the United States is visited by these men. I have seen them on the peninsula of Cape Cod, and in the neighbourhood of Lake Erie; distant from each other more than six hundred miles. They make their way to Detroit, four hundred miles farther; to Canada; to Kentucky; and, if I mistake not, to New-Orleans and St. Louis.

All the evils, which are attendant upon the bartering of small wares, are incident to this, and every other mode of traffic of the same general nature. Many of the young men, employed in this

business, part, at an early period with both modesty, and principle. Their sobriety is exchanged for cunning; their honesty for imposition; and their decent behaviour for coarse impudence. Mere wanderers, accustomed to no order, control, or worship; and directed solely to the acquisition of petty gains; they soon fasten upon this object; and forget every other, of a superiour nature. The only source of their pleasure, or their reputation, is gain; and that, however small, or however acquired, secures both. No course of life tends more rapidly, or more effectually to eradicate every moral feeling.

Berlin has, I suspect, suffered not a little from this source. Were their manufactures sold, like other merchandize; the profits would undoubtedly be lessened: but the corruption of a considerable number of human beings would be prevented.\*

I am, Sir, yours, &c.

\* The business of selling tin ware, has within a few years undergone a considerable change. Formerly the pedlar's load was composed exclusively of this manufacture: now he has an assortment of merchandize to offer to his customers. He carries pins, needles, scissars, combs, coat and vest buttons, with many other trifling articles of hardware; and children's books, and cotton stuffs made in New-England. A number set out with large waggons loaded with dry goods, hats and shoes; together with tin ware, and the smaller articles already mentioned. These loads will frequently cost the proprietor from one to two thousand dollars; and are intended exclusively for the Southern and Western States.

It is frequently the fact, that from twenty to thirty persons are employed by a single house, in the manufacturing and selling of tin ware and other articles. The workmen, furnished with a sufficient quantity of the raw materials to employ them for six months, are sent on by water, in the autumn, to Virginia, North and South Carolina, or Georgia. They station themselves at some town in the interior, where the employer, or his agent, has a store, well furnished with such articles as the pedlars require. As the stock of each pedlar is exhausted, he repairs to the store for a supply. In this way, a large amount of goods are vended during the six or eight months they are absent.

Some idea may be formed of the extent to which this business is sometimes carried, from the fact, that immediately after the late war with Great Britain, which terminated in 1815, ten thousand boxes of tinned plates were manufactured into culinary vessels in the town of Berlin, in one year. Since that time, however, the quantity demanded for this market, has greatly diminished.—*Pub.*

## LETTER II.

Hatfield—Whately—Deerfield—Battles with the Indians at Bloody Brook and Hatfield—Deerfield River—Burning of Deerfield, and captivity of Rev. Mr. Williams, and many of the inhabitants.

*Dear Sir,*

WE began our journey from Berlin on the 19th, and rode through Wethersfield, and Hartford, to Windsor: twenty-three miles. The following morning we rode through Suffield to Springfield; and, after dinner, by the South-Hadley canal to Northampton. The next day we crossed the river to Hadley; and on Friday, the 22d, we rode through Hatfield, Whately, Deerfield, Greenfield, Bernardston, and Gill, to Northfield: thirty-four miles. About two-thirds of the road are good: of the remaining third, seven miles are a heavy sand, and the rest stony and rough.

Hatfield lies opposite to the North end of Hadley, at the distance of a mile and a half. It is built chiefly on two streets: the principal, running North and South near a mile: the other, about as far, East and West. The houses are generally decent; and a small number in a better style.

Hatfield contains 9,000 acres; 2,000 of them, however, are in the bounds of Williamsburg; which, together with Whately, was formerly a parish of Hatfield: and all three were originally included within the bounds of Hadley. A part of this township is a pine plain; a part, intervals of the first quality; and the remaining part, valuable upland.

The inhabitants have for a long period been conspicuous for uniformity of character. They have less intercourse with their neighbours, than those of most other places. An air of silence, and retirement, appears every where. Except travellers, few persons are seen abroad, beside those, who are employed about their daily business. This seclusion probably renders them less agreeable to strangers; but certainly contributes to their prosper-

ity. Accordingly, few farming towns are equally distinguished either for their property or their thrift. Men, who devote themselves to their own concerns, usually manage them well. The people of Hatfield are good farmers. Their fields are cultivated, and their cattle fattened, in a superiour manner.

The principal street lies on an interval. Connecticut river anciently ran, not only where the houses are now built, but nearly half a mile farther Westward; and washed the foot of a hill, where runs a mill-stream, called Hatfield mill-river. This interval has been greatly extended towards Hadley, since the settlement of this country. Several considerable lots have been washed away from the Hadley shore, within sixty or seventy years: and tracts, equally large, have been added to the Hatfield shore. It cannot be wondered at, that this process of alluvion, and ablu-vion, which has gone on ever since the deluge, or perhaps more correctly, ever since Connecticut river broke down the ancient mound between Mount Tom and Mount Holyoke, should produce even greater changes than these. The proof, that these have taken place, is complete.

A bridge has been built over Connecticut river between Hadley and Hatfield, since the date of this journey. Hatfield was incorporated May 11th, 1670. A part of its history will be recited hereafter. In 1790, it contained 103 dwelling-houses, and 703 inhabitants; in 1800, 123 houses, and 809 inhabitants; in 1810, 805.

Whateley lies immediately North of Hatfield; and consists also of three divisions: an interval, a yellow-pine plain, and a collection of hills. The soil of the two first is indifferent; that of the last is rich. The road passes over the plain; and exhibits no part of the settlements, beside a little hamlet, consisting of a few houses, chiefly of an indifferent appearance. The hills are covered with a collection of valuable farms.

In the year 1790, this township contained 120 houses, and 738 inhabitants; in the year 1800, 773; in 1810, 891.

This plain, generally dull and wearisome to the traveller, presents, nevertheless, several fine objects to the eye; particularly

Sugar-loaf; the South end of Deerfield Mountain, and partially cut off from it by a valley. It is a sharp, and somewhat irregular, cone; singularly resembling the object, from which it derives its name. The Southern side presents a bold precipice, extending from the summit half way to the base. A huge mass of rocks, and fragments of sandstone at the bottom has been shaken off from this eminence, either by the gradual influence of time, or by some violent convulsion of nature. Two great openings between Sugarloaf and Mount Toby on the East, and the hills which have been mentioned, on the West, appear like two vistas, to which there are no limits, beside such as are formed by the imagination.

Near the Southern extremity of Deerfield is a small settlement, called Muddy brook, and anciently Bloody brook; on which, in the year 1675, there was a severe action between a body of the Colonists, and an army of savages. To give you a just view of this event, it will be necessary to have recourse to some preceding facts.

Until the year 1675, the English inhabitants of this County had lived in as perfect harmony with their neighbours, as can be supposed to exist between bodies of men, of so different characters, principles and interests. The settlers originally purchased their lands of the Indians at an equitable price; and had paid the full amount of their demands, and the real value of the purchase. In all their intercourse with them also, they had exhibited exemplary justice and humanity. The first hostilities commenced in this region, and throughout most of New-England, in consequence of the policy, intrigues, and influence, of the celebrated Philip. The character of this Sachem I have already given. With a discernment, a comprehensiveness of views, and an efficacy of address, unprecedented among the Aborigines of this country, he succeeded in a design, which few of them ever formed, and none of them was able to accomplish: that of uniting the great body of his countrymen in one effort to extirminate the Colonists. This fact, though questioned by a very respectable historian\* of New-Eng-

\*Dr. Bellknap.

land, is, I think, clearly confirmed by the writers, and the events of the period, in which it existed. It is questioned, therefore, from philosophical principles only. Nor will these principles, when the subject is fairly examined, furnish any solid foundation for doubt. The Indians of New-England, though divided into many tribes belonged to one nation; spoke one language; and had one set of customs, manners, and religious rites. Accordingly they claimed, and acknowledged, a common kindred; and styled themselves, in the proper sense, Brothers. Almost always at war with each other, they still had a common interest; and at this time felt it peculiarly. The Colonists, already numerous and formidable, were daily increasing both in numbers and power.

Jealousy easily kindled in all men, burns of course in the breast of a savage and the fuel now furnished, raised it into a flame. Almost every tribe in Southern New-England was directly solicited by Philip, or his agents, to engage in a general war against the Colonists. Such a war actually broke out at this very period: an event unprecedented, improbable, and on any other ground inexplicable. Sassacus, at a very early date, had made the same attempt without success: for the other tribes dreaded the Pequods more than they dreaded the English. This war united tribes, hostile to each other, destitute of any pretence for quarrelling with the English, and hitherto living with them in uninterrupted harmony. Such were the tribes in this Country. Finally, all this was acknowledged by the Indians of Hadley: a tribe covering a considerable extent of country, at perfect peace with the planters of their neighbourhood through forty years, and now destitute of the slightest cause for hostility. These Indians declared that they took up the hatchet by the instigation of Philip.

The first proof of their intentions was their desertion of their fortress, and their houses: a proof completely equivalent in the existing circumstances, to a declaration of war. Accordingly, they were pursued by a party of the English; and were overtaken just after they had passed the river at the foot of Sugarloaf; about eight miles above Hatfield. Here on the 25th of August 1675, a skirmish ensued, in which nine or ten of the English fell; and

about twenty six of the Indians. The rest escaped ; and joined a party of Philip's friends in the neighbourhood.

On the first of September following, they attacked Deerfield ; and burnt most of the houses. A few days afterwards, they fell upon Northfield ; and killed nine or ten of the inhabitants. Emboldened by these and several other successes, they assembled in a body of seven or eight hundred, with an intention to destroy Hatfield. Captains Mosely and Pool, were quartered here with their companies ; as was Major Appleton with another company at Hadley. The savages assaulted Hatfield at the two extremes and in the centre, at the same time. Appleton and Pool defended the extremes ; and Mosely the centre. Early in the engagement about ten of the English were killed : but the reception, which the assailants met, was so warm, and probably so unexpected, that, after burning several buildings, they fled with precipitation ; and were so much discouraged, as to leave the country for some months in quiet.

On the 30th of May, 1676, a body of six or seven hundred fell upon Hatfield again ; and burnt about a dozen houses and barns, in the skirts of the town. As the assault was made in the day time, the men were chiefly abroad in the fields, at their husbandry. The people who were left behind, betook themselves to some fortified houses, near the centre of the town, for protection. One part of the enemy attacked these fortresses : while another employed themselves in collecting and driving away, the cattle, belonging to the inhabitants. In the mean time twenty five young men from Hadley, having crossed the river soon after the attack began, forced their way, through the body of savages with invincible resolution ; and, with the loss of only five of their number, killed several of the enemy, then joining the inhabitants, who had returned from their fields, they defended the town in the most gallant manner. This brave resistance so discouraged the Indians, that they withdrew with their plunder ; and never afterwards made any serious attack upon Hatfield.

I have observed, that in September 1675, the savages invaded Deerfield, and burnt the principal part of the houses. It was

then evacuated by the inhabitants ; who fled to the neighbouring settlements for protection. Their harvest had been cut about two months before ; and having been stacked in the fields, escaped the conflagration. A number of men went from the settlements below, with a collection of teams, to bring it away. Capt. Lathrop voluntarily offered to go with a company of eighty men and protect this enterprise. The wheat, about 3000 bushels, was threshed, loaded upon carts, and without molestation conveyed to the brook mentioned above. It has been said, that the English stopped here, to gather grapes ; and that the assault was made, while they were thus employed : but Hubbard declares that the enemy fell upon them, while they were marching. Be this as it may ; seven or eight hundred Indians, on the 18th of September, attacked them at this place with their customary fury. Capt. Lathrop, with a very natural, but fatal mistake, ordered each of his men to betake himself to a tree, and to fight the enemy in their own manner. Nothing could have been more unhappy : for the Indians by their superiour numbers completely surrounded them. Every man, wherever he stood, had therefore an enemy behind him, by whom he was liable to be destroyed in the very act of pointing his musket at another. Besides, the savages, habituated to fight in this manner from their childhood, were both more alert in it, and more skilful. Every savage is trained to run with the greatest rapidity ; to conceal himself with unexampled caution ; to take every advantage, presented either by the ground, or by the forest, to deceive, and circumvent his less cautious enemy, to watch in patient silence all his motions ; and to direct towards him certain death, at the moment, and from the quarter, most unsuspected. In a word, all the skill, and all the facility, which the whole energy of a savage mind can compass, the Indians, with respect to this mode of warfare, universally possess. It is impossible therefore, that in any case of this nature they should fail of a superiority over their enemies, unless those enemies should have been habituated to the same system. When the Colonists have been long used to this manner of fighting, they have often, from superiour intelligence, been an overmatch for the Indians themselves.

Of the justice of these remarks the history of New-England has furnished many proofs; and one of the most distressing, in the present conflict. Captain Lathrop, and his company, fought with great gallantry: but they fought almost in vain. Lathrop himself fell at the commencement of the attack. Of the whole number ninety were killed on the spot: seven only escaped. The company consisted of choice young men: and is styled by Hubbard who lived in the midst of them, "the flower of the County of Essex." The tale spread with an electrical rapidity throughout New-England; and awakened, not only among their surviving friends, but throughout the country, the deepest lamentation.

Captain Moseley, who seems to have been at Deerfield when the enterprise was undertaken, marched his company with the utmost expedition to relieve Lathrop. Before he arrived the contest was over: and the savages, flushed with their success, were pillaging the dead. Having formed his men in a firm column, and commanded them to keep their ranks, he charged the Indians with an intrepidity and vigour, probably never exceeded, and utterly superiour to savage resistance. In spite of their numbers, he drove them into a swamp; and forced his way through their whole body. They then attempted to hang upon his rear; but with a presence of mind, which merits the honourable remembrance of his countrymen, he wheeled his men, and broke through the Indians a second time. In this manner he fought them five hours; and drove them several miles, with such success, that while he had but two men killed, and eight or nine wounded, he destroyed, according to the acknowledgement of the savages themselves, ninety-six of their number. His Lieutenants, Savage, and Pickering, nobly seconded the efforts of their commander; and were gallantly followed by every man in the company. So much were the savages awed, that numerous as they were after the contest was ended, and few as were their adversaries, this little band of heroes returned, that evening, to Deerfield, without molestation.

Next morning, Moseley marched again to the field of battle; and again found the savages stripping the dead. Soon after, Ma-

for Treat, from Connecticut, joined him with about one hundred men. The savages fled at the approach of Treat. The English buried the slain; and withdrew. A monument of stones was afterwards raised over them by their countrymen; and remains to the present time. But the stream, on the banks of which this memorable disaster took place, has itself become the most permanent memorial of the catastrophe, by receiving the dismal name of Bloody brook.

In populous and powerful countries, where war is a professional business, and battles are fought for the sake of dominion, victory, and glory; where success, and defeat, are regarded not as sources of life and death to the combatants, nor of sorrow to their surviving friends, but as materials for a gazette extraordinary, means of gratifying the curiosity of news-readers, and causes of national triumph, or disgrace; the inhabitants can form no idea of the distress, spread throughout New-England by this event. The day, on which it took place, is styled by Hubbard, writing soon after, "the saddest day, that ever befel New-England." The disaster, unattended with that complication, and confusion, which envelope the horrors of regular war, and hide its miseries from the eye, was sufficiently limited to be comprehended by every mind, and sufficiently particular to be felt by every heart. The very tradition, which conveyed it down to succeeding generations, was, for ninety years at least, attended with peculiar gloom and horror. I remember it perfectly, as one of the most awful and melancholy tales of childhood; and when I first passed by the spot, could not refrain from shuddering at the sight of this scene of woe. Should you think these emotions too strong for the occasion, you will remember, that the same proportional loss to England, at the present time, would be that of 13,000 men.

In the village of Muddybrook, and its neighbourhood, I preached several years; and never found so attentive a congregation. To the lasting honour of this little flock, I take pleasure in recording here, that, while many other congregations, five, six, or eight times more numerous, and richer in a still greater proportion, refused, during the period in which the continental curren-

cy was seriously depreciated, to pay the ancient stipend, customarily established for preaching; this little body of people, (and I will add those of South-Hadley also,) few in numbers, and generally in small circumstances, paid without a murmur, and without hinting a wish to the contrary, the full sum.

The township of Deerfield lies immediately North of Whateley. Its surface is of every kind, from the roughest precipice to the most elegant interval; and its soil distinguished by every variety. It commences at Connecticut river in a succession of intervals, immediately Westward of which rises Deerfield mountain. This is succeeded by the valley, mentioned in the description of Whateley under the name of the Vista; and this by a range of hills on the West, already mentioned, which form the remainder of its extent. From the Southern boundary about four miles, the space between these hills is occupied principally by a plain, about three miles in breadth; a considerable part of which is good land. North of this plain lies an extensive collection of intervals along Deerfield river, spreading into the township of Greenfield.

This river rises in Somerset, and Wilmington, in the Counties of Bennington, and Windham, and State of Vermont. Thence it runs South-Eastward through the North-Western part of the County of Hampshire, until it passes about two miles South of the town of Deerfield. Then, turning directly North, it runs four miles farther; and dividing Deerfield from Greenfield, directs its course Eastward two miles, through a gap in the Deerfield mountain, into the Connecticut. Its whole length is about forty miles. This stream is of considerable size; and remarkably rapid and violent. During most of its course, it passes between high and steep mountains. Rains therefore, and melted snows, suddenly raise its waters to a great height; and often exhibit the liveliest images of that fury, and ravage, which is so favourite a theme of poetical description. In the spring especially, the disruption of its ice at times presents to the eye and ear terrifying specimens of physical power, and most impressive exhibitions of awful and preeminent grandeur.

But in the mild and beautiful periods of the year, few scenes are more delightful, than this river and its borders. The intervals, which accompany the whole of its Northern, and a considerable part of its Eastern, course, are unusually elegant, and productive. The town itself is situated on a handsome elevation, in the midst of luxuriant meadows and orchards. In union with these objects, the neighbouring mountain on the East, the more distant hills on the West, covered with farms and forests, and the river winding at the bottom, form a landscape, which, more than most others, engages the eye of a traveller.

The town is built on an elevation spreading out from the foot of the mountain. The principal street, on which stand three fourths of the houses, runs from North to South. The buildings are generally neat; and exhibit every where a tidy, thrifty appearance. The inhabitants are generally farmers; and of the first class in this country. Few places can boast of larger crops; and none of finer, fatter beeves. Indeed, the stall-fed beef of this, and other towns in the County of Hampshire, is proverbially distinguished throughout the Northern parts of the United States.

The people of Deerfield have ever been patrons of education. In the year 1797 they raised, by subscription, a considerable fund; and finished a commodious building for an Academy. The State added to it a township, of unsettled land, in the District of Maine. The usual number of students may be considered as varying from forty to eighty. In four years there have been admitted four hundred and seventy-six: a considerable number of them, however, for short terms. The institution is flourishing. Deerfield contains but one congregation, and scarcely a dissenting individual. With the exception of a short period, during the American revolution, when they were unhappily engaged both in ecclesiastical and political contentions, the inhabitants have been distinguished for uniform harmony, good order, and good morals.

Deerfield was granted by the Legislature in the year 1669; and began to be settled in 1671. The first four years the inhabitants lived happily with the natives. Between 1675, and 1763, attacks were made upon the town, or upon some of its inhabitants, about

thirty times. Twice it was burnt; in 1675, and in 1704; and twice deserted; in 1675, and in 1677. In 1677, some of the inhabitants returned to it; but were driven off the second time, and did not renew the effort until 1682. In 1704 forty of the inhabitants were killed; and more than one hundred taken prisoners: amounting to one half of their whole number. Of this tragedy a particular account was written by the Rev. John Williams, their Minister; who was himself taken prisoner, and could truly say:

"Quæque ipse miserrima vidi,  
Et quorum pars magna fui."

After the death of Philip, in August 1676, the war, which he had instigated, continued for some time; and in several of the following years various mischief was done to the inhabitants of this unfortunate town. From the year 1688 to the year 1760, the French in Canada, who had gained an ascendancy over many of the savage tribes, made it a primary part of their policy to excite these people to depredations on the Colonists of New-England. No nation was ever so eagerly attentive to its political interests as France; and no government ever pursued its interests with equal fraud, cruelty, or destitution of principle. Until the late irruption of Infidelity in Europe, no men were ever more zealously engaged in making proselytes than the Canadian Clergy, or less encumbered with moral restraints. The government demanded scalps; and paid a bounty for them. The Clergy called for captives, whom they might convert to the Romish religion. The demands of both were clamorous; and produced an uninterrupted succession, and an immense diffusion, of fire and slaughter.

In the year 1697, the savages attacked Deerfield: but the inhabitants with Mr. Williams at their head, made so timely and vigorous a resistance, that the attempt miscarried. In 1703, Colonel Schuyler of Albany, to whom the people of New-England were not a little indebted for friendly offices of this nature, advertised the Deerfield people, that an expedition against them was on foot. Mr. Williams earnestly seconded his monitions; and warned his parishioners to prepare for their defence. He also

applied to the government for a guard. His parishioners slept in quiet, and the government, as if they meant to laugh at the apprehensions of danger, sent a guard of twenty men. The pretence for the intended expedition was to avenge some wrongs, done by Sir Edmund Andros to Monsieur Castine of Penobscot. Andros had plundered the house of Castine. Castine complained to the Governour of Canada, and the Governour, a true French Jurist, promised him, as a compensation, that he would burn some of the New-England villages, and slaughter their inhabitants.

On Tuesday, February 29th, 1704, three hundred Frenchmen and Indians, under the command of the infamous Hextel De Rouville, broke in upon this unhappy town a little before day-break. Even the Watch partook of the common stupidity; and lay down to sleep, two hours before day. The enemy, who had for some time been employed in reconnoitering the town, perceiving every thing to be quiet, attacked the fortified house, in which the garrison was kept; and made themselves masters of it without any difficulty. A party of them then forced the doors of Mr. Williams' house. Awaked by the noise, he saw a number of them entering his bed-room; and snapped his pistol at an Indian, who first came to his bed-side. But he was immediately seized, disarmed, and bound; and kept standing in his shirt near an hour. His house, in the mean time, was plundered of every thing valuable: and two of his children, together with a black female servant, were killed in cold blood before the door. They then permitted him, and Mrs. Williams, with five other children, to put on their clothes. The town around them was on fire: and every house but one, the next to that of Mr. Williams, presented all the horrors of slaughter and desolation. This house, although attacked by the whole force of the enemy, was so gallantly defended by seven men only, that the invaders despaired of success, and withdrew. The house is still standing: and we were gratified by seeing a hole in the door, cut by these savages, and the marks of their bullets on the walls.

When the work of devastation was finished elsewhere, the ravagers set fire to Mr. Williams' buildings; and conducted him,

and his remaining family, across the river to the foot of the hills, a mile from the town. This was the place of general rendezvous. Here they were joined by about an hundred more of the inhabitants; men, women, and children. The assailants had destroyed, burned, killed, or captivated, every thing within their power; and ended the work of desolation, only because there was nothing more to be done. Forty-seven persons fell in the sacking of the town, of whom thirty-eight were inhabitants.

The journey of these captives lay over the range of the Green Mountains; steep, and difficult of access; encumbered with swamps; buried in snow, and covered with forests, which in many places were scarcely penetrable by man. Not a house, beside a weekwam, existed between Deerfield and Canada; nor an inhabitant, who was not a savage. Their route over these mountains cannot now be exactly traced: but it probably measured not less than forty or fifty miles.\* A journey of more difficulty, distress, and horror, cannot be imagined, than that of this venerable minister, before he arrived at Chamblee. He was lame, bound, insulted, threatened, wearied to anguish, and half starved. The first night, after he left Deerfield, some of the Indians murdered his black servant before his eyes. On the second day, his wife, whom he had been forbidden to assist, was tomahawked by a savage: and on that, and several succeeding days, seventeen other persons, belonging to his congregation, met with the same fate. Two more perished with hunger.

As the enemy marched out of Deerfield, they were pursued, and attacked, by a body of men from Hatfield; and lost more than forty of their number. When the assailants desisted from their pursuit, it was apparently from the apprehension, that any further attempt would prove fatal to their captivated countrymen.

After Mr. Williams arrived in Canada, it is but justice to say, he was generally treated with civility; and often with humanity. At the end of two years he was redeemed; and on October 26th, 1706, left Quebec, together with fifty-seven captives: among whom were two of his children. On the 21st of the following

\* The whole distance was about 230.

month they arrived at Boston ; where they were received with the kindness, dictated by the Religion of the Gospel. Soon after his arrival, the inhabitants of Deerfield sent a committee, to solicit his return. The war still continued : and the town was still exposed to similar ravages. Yet he yielded to their solicitation. Eleven of the remaining years of his life were years of war. The inhabitants were frequently alarmed and harassed ; and a considerable number were captivated or slain ; but they never suffered, again, a destruction equally comprehensive. The following twelve years he passed in peace ; and died in 1729, in the sixty-sixth year of his age, and the forty-eighth of his ministry.

Two of his sons were educated at Harvard College ; and afterwards settled in the ministry : one, at Long-meadow ; the other, at Waltham, near Boston. Two more were settled in Deerfield : and all of them were much respected. The family has become numerous ; and is spread through various parts of the country.

One of his children, a daughter, seven years old when she was carried into captivity, never returned to his family. Great efforts were made by the Government, and by individuals, for her redemption : but the savages, who had adopted her as their child, could never be persuaded to give her up. She was afterwards married to a Sachem, by whom she had several children. Some of them are, or were lately, still living ; and were persons of superiour consideration among their countrymen. One of her grand children has been educated at Longmeadow in a respectable manner. I have seen this young man. He has a very good countenance, pleasing manners, a good understanding, and apparently an excellent disposition, with scarcely a trace of the Indian character. He is destined to the employment of a Missionary.\*

A small fort in the Southern part of Deerfield escaped the general destruction. It was violently attacked ; but it was also bravely defended. This event was the means of preserving many of the inhabitants, and preventing the town from being deserted.

\* Mr. Williams is now a Missionary among the Oneidas.—*Pub.*

To all these evils Deerfield was peculiarly exposed by its situation. It was on the frontier; was thirteen miles from Hatfield, whence alone it could receive effectual assistance; and was built at the foot of a mountain on the East, and at a small distance from a range of hills on the West. From these heights the savages saw every thing, which invited, or discouraged, an attack; and in the forests, which covered them, were concealed from detection. Here they were able to make a descent in a moment; and in a moment to secure themselves from pursuit. The agriculture of the inhabitants was principally carried on in the intervals lying between these heights, at some distance from the town; which, peaceful and smiling as they now appear, were often scenes of blood. Here solitary individuals, and little companies, were shot down in the hour of security; their scalps taken off; or themselves seized, and conveyed to Canada: while the first intelligence of their fate was the sight of their corpses, or tidings of their arrival at Montreal. It ought to be added that the valley of Deerfield river, and the waters of Otter Creek, streams nearly coinciding in their direction, furnished the most safe and convenient passage for the Indians from Lake Champlain to the New-England settlements in this quarter. The first object, which presented itself as their prey in the journey, was Deerfield. With such a combination of circumstances, singularly favourable to savage invasion, the peculiar sufferings of its inhabitants cease to excite wonder.

Deerfield originally included Greenfield, Conway, Shelburne, and a part of Gill. In 1704, there were in the township 280 inhabitants; and, in 1763, 1,105: of which 737 belonged to Deerfield, and 368 to Greenfield, then a parish.

In 1790, there were in Deerfield 181 dwelling-houses; in Greenfield, 224; in Shelburne, 169; and in Conway, 306: in all, 780. The number of inhabitants in Deerfield at this time was 1,330; in Greenfield, 1,498; in Shelburne, 1,183; and in Conway, 2,093: in the whole, 6,204. In 1800, the number of inhabitants in Deerfield was 1,531; in Greenfield, 1,254; (a part being then included in the incorporation of Gill,) in Shelburne, 1,079; in Con-

way, 2,013; and in the part of Gill, originally included in Deerfield, 144: total, 6,021.

Between 1704, and 1763, the number of the inhabitants was doubled in about thirty years; and from that period to 1800 in about fifteen. In the former period the progress of population was both prevented, and lessened, by war: in the latter it was extensively derived from immigration.

In the year 1810, Deerfield contained	- - -	1,570

### LETTER III.

Progress of Vegetation—Greenfield—Bernardston—Gill—Battle with the Indians, called the *Fall Fight*—Northfield—Attacks of the Indians.

*Dear Sir,*

IN the interval below Deerfield we passed on the 22d, the first field in which the harvest of maize had been gathered. The day following we saw several others in an interval above Northfield, in the same situation. At Haverhill, on the 28th, we found the inhabitants in the midst of their harvest; and at Lancaster, on the 30th, the harvest was nearly finished. At New-Haven it was scarcely more than half through, on the 20th of the following month. I could not avoid being struck with the wisdom and goodness, of God, conspicuous in these facts. In the opening of the spring, vegetation is earlier on the Sound than in any part of the interior, situated (unless in some warm soils, and exposures,) even at no great distance. The maize, particularly, is growing at New-Haven several weeks before it is planted at Lancaster; and, a still longer period, before it is planted on the neighbouring hills. It has often been said, and I presume with truth, that a traveller might eat the first green peas at St. Mary's in the South-Eastern corner of the United States; and, proceeding thence by moderate journeys, might also eat the first green peas, daily, throughout the whole distance to Machias, in the North-East corner. It will not be supposed, that absolute exactness is here intended: but that the assertion is true, in a loose and general sense, I have no doubt: the effects of peculiar skill in gardening, and of favourable and unfavourable exposures, being laid out of the question. From the Sound to the 45th degree of latitude the progress of the vernal vegetation, even when traced through the valleys, is varied in a greater degree than is here supposed; when referred to the mountains, the difference is greater still. From a period in the summer, estimated from the 20th to the 30th of June, the vegetation of the interior advances upon that

of the coast ; and ultimately becomes, with respect to many vegetables, much more forward. This is especially applicable to maize : which, more than any object of agriculture in this country, demands the influence of intense heat.

The cause of this phenomenon may be thus explained. In the spring, the ocean is warmer than the land. By the breezes from the ocean vegetation is quickened earlier, and advanced faster, on the shore of the Sound, than in the interior, through March, April, and the principal part of May: the time, however, differing materially in different years. In the latter part of May, and the beginning of June, the atmosphere over the land becomes warmer than that over the ocean. By the land breezes then, and even by the sea breezes also, when warmed by blowing some distance over the land, the vegetation of the interior is regularly advanced towards that of the shore. By the beginning of June some, by the middle of that month more, and by the middle of July most, of the vegetables of the interior are equally advanced with those on the Sound. Then the sea breezes have usually become cooler than those of the land; and, in a comparative view, may be said to check the vegetation on the shore. This process continues through the summer, with an increasing difference in favour of the interior vegetation.

But for this order of things, maize, a plant uncommonly tender, would in all the Northern parts of this country be frequently cut off by the early frosts in autumn; and the crop rendered so precarious, as to discourage the inhabitants from attempting to produce it. Now, though somewhat more uncertain in the Northern parts of the country, than on the shore, it is yet so safe, as to be a regular object of general cultivation. An inhabitant of New-England cannot need to have the importance of this fact explained. When you are informed, that maize is nearly as valuable to this country, as all other kinds of corn united; and yields a crop much more certain, and much more extensively useful, than any other; you will, I presume, agree with me in admiring that wisdom and goodness, which has been the theme of these remarks.

The road from Deerfield to Greenfield was formerly exposed to serious inconveniences. As it crossed the interval between these towns, it was deluged by the river whenever its waters were high; and was, also, rendered troublesome by a ferry. It now passes directly under Deerfield Mountain. A handsome toll-bridge is here erected over the river, consisting of a single arch; the chord of which is about two hundred feet. Hence winding along the margin of one of the most beautiful and vivid intervals in New-England, and then ascending a slope on the borders of Green River, the road enters Greenfield. This town is principally built on a single street, running East and West, parallel with the course of Deerfield River. The houses are generally good: a few of them may be termed handsome. It is said that there is more business, of various kinds, done in this town, than in any other in this County, except Northampton and Springfield. The number of traders, and mechanics, is considerable; and the town exhibits a general aspect of sprightliness and activity.

The principal part of this township is composed of an extensive plain, spreading about twelve miles in length, and four or five in breadth. On the Eastern part of the township runs a succession of eminences, of moderate height, which are a continuation of Deerfield mountain. The soil on, and near these eminences is for some extent light and sandy; that of the plain is moderately good; and that along Green River, near the western border, is excellent. Most of this township is divided into farms. The inhabitants are united in one Congregation.

At the South-East corner of Greenfield is erected a bridge over Connecticut river. It consists of four arches, built on four piers of stone, with a semicylindrical face up the river. The appearance of these piers is handsome: but they leave the disagreeable impression of weakness and fragility. It is however alleged, that the ice, in passing the falls and rapids above, is universally broken into small fragments; and that the bridge can never be in danger. Hitherto it has received no injury. The structure certainly reflects honour on the undertakers.

Greenfield contained in 1790, 1,498 inhabitants; in 1800, 1,254; and in 1810, 1,165.

Bernardston lies immediately North of Greenfield ; and is principally composed of the plain, which constitutes so considerable a part of that township. The soil appears to be moderately good ; and the houses generally wear the same character. The township is universally distributed into farms ; and includes but one congregation. In 1790, it contained 101 houses, and 691, inhabitants ; in 1800, it contained 780 inhabitants ; and, in 1810, 811.

In the upper parts of Bernardston the road to Northfield turns directly to the East through the Northern skirts of Gill ; unless I am deceived with respect to its boundaries. This last township is formed of Greenfield, and Bernardston ; and lies immediately Eastward of both along the border of Connecticut river. As seen from the road on the Eastern side of the river, it is a beautiful tract of land ; consisting of a fine succession of intervals ; soft, easy slopes, ascending from them ; and a chain of hills, immediately beyond these, formed with unusual elegance. This township was incorporated in 1793. It includes one congregation ; and, in 1800, contained 700 inhabitants ; and in 1810, 762.

In this township was fought, May 17th, 1676, a battle with the Indians, known in this country by the name of *the Fall-Fight*. After many ravages, committed on the neighbouring towns, a large body of these people had seated themselves along the western bank of the river, at and above Miller's Falls. From an apprehension, that the English had become quiet, the Indians had fallen into a state of security, with which they have rarely been chargeable, when so near to an enemy. Of this fact the English in the neighbouring towns were informed by some of their own people, who had been made prisoners, and fortunately escaped. One hundred and sixty-men, including a company of soldiers from Boston, marched from Springfield, Northampton, Hadley, and Hatfield, to attack them. The Rev. Mr. Atherton, Minister of Hatfield accompanied them. The troops set out from Hatfield in the afternoon ; and while crossing Deerfield river in the night, alarmed an Indian sentinel. The alarm being communicated by him to his countrymen, a number of them went to search at the customary fording place ; but, no traces of an enemy being found,

concluded, that the noise must have been made by the travelling of the moose through the water in that vicinity. The Indians then lay down again to sleep. In this unguarded situation they were awaked by a firing upon their weekwams. They supposed themselves attacked by their ancient enemies, the Mohawks; and, after perceiving their mistake, were in such a state of surprise and confusion, as scarcely to attempt any serious resistance. Many were killed outright. Others ran into the river, and were drowned. Others fled to their canoes; and having forgotten to take their paddles with them, were carried over the falls and destroyed; while others, who attempted to hide themselves in the neighbourhood, were detected, and slain. The preceding day they had held a great feast, the materials of which were supplied by cattle pillaged from the English. When Indians feast they eat to surfeiting. They slept heavily, therefore; and when roused by the alarm, were scarcely in possession of their senses. After the English had retreated, the Indians who survived, having discovered, that the number of their enemies was but small, and having summoned a body of warriors from the neighbouring tribes, pursued the invaders. They now greatly outnumbered the English, and followed them almost to Hatfield. The English were unfortunate in their retreat in having a sickly commander, Captain Turner, and in being ill supplied with ammunition. For ten miles their passage was disputed inch by inch. Thirty-seven of them were killed on the march; and several others, having been separated from the main body by accident, and lost their way, were taken and destroyed. The Indians acknowledged, that they lost three hundred. Captain Holyoke of Springfield merited, and acquired, high reputation for his gallantry, and good conduct, in this enterprise. The Rev. Mr. Atherton was one of those, whom the confusion of the retreat early separated from the main body. Having lost his way, he wandered the night following among the weekwams, undiscovered. The next day, exhausted with hunger, he offered to surrender himself to them as a prisoner; but they declined receiving him. He accosted them, but they would not answer. He walked towards them, and they fled.

Upon this he determined to make his way, if possible, to Hatfield by the river-side ; and after wandering several days, and suffering excessive hunger, arrived in safety. The Indians probably considered him as a sacred person, whom it was unlawful to injure. Their treatment of Mr. Williams was in all probability directed by their French allies.

This expedition was the means of discouraging the savages from any farther attempts, of a serious nature, upon the English settlements in their neighbourhood, during the remainder of the war. Indeed, the Indians of this region never appeared, afterward, to make any considerable figure.

Northfield is the Northernmost township in this County on the Eastern bank of Connecticut river. A great part of it is excellent land, particularly several very valuable Intervals on both sides of the river. The town-plot contains, also, a charming collection of rich meadows. The range of Mount Toby, mentioned above, runs along the Eastern part of this township ; and furnishes a plentiful supply of timber, and fuel, for the inhabitants. The town of Northfield is built on a single street, about a mile in length, and running parallel with the river on a very handsome elevation. The town itself is pleasant, and contains a considerable number of well appearing houses. The scenery around it is composed of rich meadows ; beautiful Intervals : the river, pleasantly winding for several miles ; an extensive collection of hills ; and a magnificent view of distant mountains, particularly on the North-West. There is scarcely a more agreeable ride in New-England than that from Northfield to Brattleborough.

Northfield was incorporated in 1673. In 1675, the Indians attacked this infant settlement, and killed nine of its inhabitants. The rest escaped to a fortified house. The next day, before the news of this disaster had reached him, Captain Beers was sent, with thirty-six men, to carry supplies to the garrison. On their march, they were way-laid, and surprised, by several hundred Indians. They fought gallantly ; but twenty of them, with their brave commander, fell. The rest escaped to Hadley. Two days

afterwards, Major Treat, arriving with one hundred men, conducted the remaining inhabitants to the settlements down the river.

For ten years the town was deserted. In 1685, the settlement was begun anew. It was, however, destroyed a second time. In 1713, they returned again; and since that period were never wholly broken up; but they suffered the usual evils of an Indian neighbourhood until 1763.

Northfield includes one congregation. In 1790 it contained 120 houses, and 868 inhabitants. In 1800 the number of inhabitants was 1,047; and in 1810, 1,218. I am, Sir, yours, &c.

## LETTER IV.

**Hinsdale—Indications of a Volcano in West River Mountain—Defeat of the Indians by Captain Hobbs—Capture of Bridgman's Fort—Account of the captivity of Mrs. Howe; her sufferings, and return to New-England.**

*Dear Sir,*

SATURDAY, September 25th, we left Northfield: and passing through Hinsdale, Chesterfield, and Westmoreland, arrived at Walpole just before evening: thirty-two miles. The road throughout a considerable part of the distance was rough and unpleasant. Between Northfield, and Hinsdale, we crossed the Ashuelot, one of the considerable tributary streams of the Connecticut, to be mentioned hereafter. This river in its Western course is the boundary between Massachusetts and New-Hampshire.

Hinsdale received its name from Colonel Hinsdale, a principal planter; who, together, with several other persons, was allured to this spot by the intervals along the Connecticut. It formerly extended over that river: but the part, which lay on the Western side, is now a township of Vermont, named Vernon.

Hinsdale consists of a narrow level tract along these rivers, and a collection of hills and mountains, which are a part of the range of Mount Toby. The soil is moderately good; and the surface, bordering upon the rivers, is pleasant.

In a journey, which I took in 1798, I visited Hinsdale for the purpose of examining West river mountain, reported many years since to have been in a very humble degree volcanic. A Mr. Butler of this town, to whom we were recommended for information, accompanied us to the spot. The mountain is in the Northern limit of the township; and terminates on the Connecticut in a bold bluff, from eight to nine hundred feet above low-water mark.

About one hundred and fifty feet from the summit, we found a pit, sixty or seventy feet deep, dug by the neighbouring inhabitants, with the hope of finding some species of ore. We had no

means of descending into it, and were enabled to examine it, only in a very imperfect manner from the surface above. From our guide, and some other persons, whom we found at an inn, we received the following story. Twenty-three years before, the people of the neighbourhood were alarmed by a loud noise, proceeding from this mountain, and resembling the sound of cannon. A Mr. Barrett, who visited the place, found a hole, forced through the mountain by a blast, evidently as he thought the result of intestine fire. The hole was about six inches in diameter. A pine tree, which stood near it, was in a great measure covered by a black mineral substance, forced violently out of the passage, and consisting chiefly of melted and calcined, iron-ore strongly resembling the scoriæ of a blacksmith's forge. It was forced out in a state partially liquid; and driven with such violence against the tree, as not to be separated without difficulty. The tree stood several years afterwards; but was cut down, and carried away, before we visited the place. The same calcined, and vitrified, substances were, however, still adhering to the rocks and earth in several places; and could not be broken off without a violent effort. From the whole appearance it was completely evident, that it was driven against the cliffs in the same liquid state. The cliffs were of the common grey granite of this country; and exhibited no appearance of having been heated.

At a little distance from the pit there was a large pile of calcined and vitrified ore. A quantity of yellow ochre, also, was dug out of the pit; a part of which, coarse, mixed with other substances, and unfit for use, was still lying in the vicinity. Specimens of the ochre, and of the vitrified ore, I brought to the cabinet of Yale College.

We saw a little below the pit, two holes; one circular, the other of an irregular figure; which I at first supposed to have been made by animals. A nearer inspection convinced me, that this was impossible, and that they must have been formed by a blast of air from the bowels of the mountain.

Hinsdale was incorporated in 1763, and settled many years before. It experienced, often, the sufferings of Indian invasion. In

July 1746, Colonel Willard of Winchester, a neighbouring town, came with a guard of twenty men to a mill, belonging to Colonel Hinsdale, for the purpose of grinding corn. Our ancestors, like the workmen of Nehemiah, were obliged to hold their weapons in one hand, and their instruments of labour in the other. The guard was scarcely set, when it was fired upon. The fire was returned with spirit. Colonel Willard gave loud, and repeated orders to his men to attack the enemy. The savages from this circumstance believed their enemies to be numerous : for they fled with such precipitation, that they left behind them, what Indians never leave if they can avoid it, their packs and provisions.

On June 16th, 1748, four men were killed, and six captured, as they were crossing from Colonel Hinsdale's to Fort Dummer. Only one escaped.

On the 26th of the same month, Captain Hobbs, marching with forty men from Charlestown in New-Hampshire, was followed to Dummerston, within ten or twelve miles above Fort Dummer, by a numerous body of savages. Hobbs, while the company stopped to take their dinner, prudently placed centinels in their rear. A few minutes afterwards, the savages fired upon the scout, while the company were eating. Hobbs arranged his men in a moment, and faced the enemy, advancing with the usual Indian celerity. For four hours this little party fought with invincible resolution, and with such success, that their assailants finally fled with precipitation, and with great loss. Three only of the English were killed ; and three wounded. Mr. Taylor, from whose account this history was taken, justly observes, that, if Hobbs' men had been Romans, they would have been crowned with laurel, and their names transmitted with perpetual honour to succeeding generations. The success of this party was owing particularly to the fact, that they had learned the best method of fighting the Indians, and thus acquired the proper superiority of civilized over savage men. On the 14th of the following month, of seventeen men, who were crossing from Colonel Hinsdale's to Fort Dummer, all were killed or made prisoners, except four.

In 1755, Bridgman's fort, a small work in Vernon was taken by the following stratagem. The men, residing in the fort, (Caleb Howe, Hilkiah Grout, and Benjamin Gaffield,) went into the field to perform their daily labour. Their wives, remaining in the fort, fastened the gate according to custom: and were to open it, when their husbands and sons, returning, knocked for admission. The men, having finished their work, were returning to the fort, when a party of twelve Indians fired upon them. Howe was wounded in the thigh, and fell from the horse, on which he rode with two of his sons. The Indians instantly came up, and scalped him. He was found the next morning, alive, by a party of men from Fort Hinsdale, but soon after expired. Grout escaped unhurt. Gaffield, attempting to cross the river, was drowned.

The women heard the noise of the firing, but seem not to have suspected the cause. The Indians, having learned by observation the mode of gaining admission into the fort, knocked at the gate. It was opened without hesitation: and all within the fort were made prisoners. Mrs. Gaffield had one child; Mrs. Grout three; and Mrs. Howe seven; the youngest an infant six months old, the eldest eleven years. Should it seem strange, that these enemies thus learned the signal of admission; you will remember, that an Indian can conceal himself with inimitable skill, and success, and wait any length of time, to accomplish his purpose.

After having plundered the fort, and set it on fire, the Indians conducted their prisoners about a mile and a half into the forest. Here they continued through the next day; but despatched six of their number to complete the work of destruction. The following morning they set out for the place, where they had left their canoes about fifteen miles South of Crown Point. The distance was about sixty miles; but, as they were obliged to cross the range of the Green Mountains, it occupied them eight days. The Indians were desirous to preserve their prisoners; and in most instances, therefore, treated them kindly, in their manner. Yet they abused some of them in the customary modes of savage cruelty.

After many and severe sufferings, they reached Crown Point, where Mrs. Howe, with several of the prisoners, continued a few days. The rest were conducted by their captors to Montreal, to be sold to the French; but, no market being found for them, were all brought back, except her youngest daughter, who was given as a present to Governor De Vaudreuil. Soon after the whole body embarked in canoes, just as night was approaching, for St. Johns. A thunder-storm arose in the West. The darkness, when it was not illumined by lightning, was intense. The wind became a storm; and the waves, which in this lake have not unusually been fatal to vessels of a considerable size, threatened their destruction. But they were not deserted by Providence. A little before day-break they landed on the beach: and Mrs. Howe, ignorant of what had become of her children, raised with her hands a pillow of earth, and laid herself down with her infant in her bosom. The next day they arrived at St. Johns, and soon after at St. Francis; the residence of her captors. A council was called; the customary ceremonies were gone through; and Mrs. Howe was delivered to a squaw, whom she was directed henceforth to consider as her mother. The infant was left in her care.

At the approach of winter, the squaw, yielding to her earnest solicitations, set out with Mrs. Howe, and her child, for Montreal, to sell them to the French. On the journey both she and her infant were in danger of perishing from hunger and cold: the lips of the child being at times so benumbed, as to be incapable of imbibing its proper nourishment. After her arrival in the city, she was offered to a French lady; who, seeing the child in her arms, exclaimed, "I will not buy a woman, who has a child to look after." I shall not attempt to describe the feelings with which this rebuff was received by a person, who had no higher ambition than to become a slave. Few of our race have hearts made of such unyielding materials, as not to be broken by long-continued abuse: and Mrs. Howe was not one of this number. Chilled with cold, and pinched with hunger, she saw in the kitchen of this inhospitable house some small pieces of bread, floating

in a pail, amid other fragments, destined to feed swine : and eagerly skimmed them for herself. When her Indian mother found that she could not dispose of her, she returned by water to St. Francis, where she soon died of the small pox, which she had caught at Montreal. Speedily after, the Indians commenced their winter hunting. Mrs. Howe was then ordered to return her child to the captors. The babe clung to her bosom : and she was obliged to force it away. They carried it to a place, called "Messiskow," on the borders of the river Missiscoui, near the North end of Lake Champlain upon the Eastern shore. The mother soon followed ; and found it neglected, lean, and almost perishing with hunger. As she pressed its face to her cheek, the eager, half-starved infant bit her with violence. For three nights she was permitted to cherish it in her bosom ; but in the day-time she was confined to a neighbouring weekwam, where she was compelled to hear its unceasing cries of distress, without a possibility of contributing to its relief. The third day the indians carried her several miles up the lake. The following night she was alarmed by what is usually called the great earthquake, which shook the region around her with violent concussions. Here, also, she was deserted for two nights in an absolute wilderness : and, when her Indian connections returned, was told by them, that two of her children were dead. Very soon after she received certain information of the death of her infant. Amid the anguish, awakened by these melancholy tidings, she saw a distant volume of smoke ; and was strongly inclined to make her way to the weekwam, from which it ascended. As she entered the door, she met one of the children, reported to be dead ; and to her great consolation found that he was in comfortable circumstances. A good-natured Indian soon after informed her, that the other was alive on the opposite side of the lake, at the distance of a few miles only. Upon this information she obtained leave to be absent for a single day ; and, with the necessary directions from her informant, set out for the place. On her way she found her child lean, and hungry ; and proceeded with it to the weekwam. A small piece of bread, presented to her by the Indian

family, in which she lived, she had carefully preserved for this unfortunate boy; but, to avoid offending the family, in which he lived, was obliged to distribute it in equal shares to all the children. The little creature had been transported at the sight of his mother; and, when she announced her departure, fell at her feet, as if he had been dead. Yet she was compelled to leave him; and satisfied herself, as far as she was able, by commending him to the protection of God. The family in which she lived, passed the following summer at St. Johns. It was composed of the daughter, and son-in-law, of her late mother. The son-in-law went out early in the season on an expedition against the English settlements. At their return, the party had a drinking frolic: their usual festival after excursions of this nature. Drunkenness regularly enhances the bodily strength of a savage, and stimulates his mind to madness. In this situation he will insult, abuse, and not unfrequently murder, his nearest friends. The wife of this man had often been a sufferer by his intemperance. She therefore proposed to Mrs. Howe, that they should withdraw themselves from the weekwam, until the effects of his present intoxication were over. They accordingly withdrew. Mrs. Howe returned first, and found him surly, and ill-natured, because his wife was absent. In the violence of his resentment he took Mrs. Howe, hurried her to St. Johns, and sold her for a trifling sum to a French gentleman, named Saccapée.

Upon a little reflection, however, the Indian perceived, that he had made a foolish bargain. In a spirit of furious resentment he threatened to assassinate Mrs. Howe; and declared, that if he could not accomplish his design, he would set fire to the fort. She was therefore carefully secreted, and the fort watchfully guarded, until the violence of his passion was over. When her alarm was ended, she found her situation as happy in the family, as a state of servitude would permit. Her new master and mistress were kind, liberal, and so indulgent as rarely to refuse any thing, that she requested. In this manner they enabled her frequently to befriend other English prisoners, who from time to time were brought to St. Johns.

Yet even in this humane family she met with new trials. Monsieur Saccabee, and his son, an officer in the French army, became at the same time passionately attached to her. This singular fact is a forcible proof, that her person, mind, and manners, were unusually agreeable; for she had been twice married, and the mother of seven children. Nor was her situation less perplexing than singular. The good will of the whole family was indispensable to her comfort, if not to her safety; and her purity she was determined to preserve at the hazard of her life. In the house, where both her lovers resided, conversed with her every day, and, together with herself were continually under the eye of her mistress; the lovers a father and a son; herself a slave; and one of them her master; it will be easily believed, that she met with very serious embarrassments in accomplishing her determination. In this situation she made known her misfortunes to Colonel Peter Schuyler of Albany, then a prisoner at St. Johns. This gentleman I have already mentioned with honour; and he well merits the most respectful, and lasting, remembrance of every inhabitant of New-England, for his watchful attention to the safety of its settlements, and his humane interference in behalf of its captivated inhabitants. As soon as he had learned her situation, he represented it to the Governour De Vaudreuil. The Governour immediately ordered young Saccabee into the army; and enjoined on his father a just, and kind, treatment of Mrs. Howe. His humanity did not stop here. Being informed, that one of her daughters was in danger of being married to an Indian, of St. Francis, he rescued her from this miserable destiny; and placed her in a nunnery with her sister. Here they were both educated as his adopted children.

By the good offices of Colonel Schuyler also, who advanced twenty-seven hundred livres for that purpose, and by the assistance of several other gentlemen, she was enabled to ransom herself, and her four sons. With these children she set out for New-England in the autumn of 1758, under the protection of Colonel Schuyler; leaving her two daughters behind. As she was crossing Lake Champlain, young Saccabee came on board the boat, in

which she was conveyed; gave her a handsome present; and bade her adieu. Colonel Schuyler, being obliged to proceed to Albany with more expedition than was convenient for his fellow travellers, left them in the care of Major Putnam, afterwards Major-General Putnam. From this gentleman she received every kind office, which his well-known humanity could furnish; and arrived without any considerable misfortune at the place of their destination.

After the peace of Paris, Mrs. Howe went again to Canada, to bring home her second daughter: the eldest having been taken by Monsieur De Vaudreuil to France, and married in that country to a gentleman named Louis. Her sister had become so attached to the life, customs, and religion of a nunnery, and so alienated from her country, and even from her parent, as to be absolutely deaf both to solicitation, and authority. When she was compelled by the peremptory orders of the Governour to leave the convent, she lamented bitterly her unhappy lot, and refused consolation. This is one among the many instances of the perseverance, art, and efficacy, with which the Religious in Canada laboured to make disciples of the children, taken from New-England. Beside all the horrors of war, and captivity, the parent in this case was forced to suffer the additional, and excruciating anguish of seeing his children, lost to him in this world, and exposed to every danger of finally losing a better.

In this journey Mrs. Howe met with the younger Saccabee; and found that he had not forgotten his former attachment.

That part of Hinsdale, which lies between the mountains, and Connecticut river, is pleasant and romantic. The township includes one congregation; and, in 1790, contained 522 inhabitants; in 1800, 634; and, in 1810, 740.

I am, Sir, yours, &c.

## LETTER V.

Chesterfield—Westmoreland—Walpole—Colonel Bellow.

Dear Sir,

CHESTERFIELD lies immediately North of Hinsdale. The township is generally composed of hills: one of them mountainous. The soil is good grazing land, distributed into farms. Around a church in the centre there is a hamlet of decent houses.

Chesterfield was incorporated in 1752. The number of its inhabitants in 1775, was 874; in 1790, 1,905; in 1800, 2,161; and, in 1810, 1,839.

They are said to be much divided in their religious opinions, and separated into four or five congregations. These divisions are unhappily, but very commonly, found in new settlements. The planters, coming together more by casualty than by design, bring with them all their former habits of thinking. Their religious principles, their views of ecclesiastical discipline, and their scheme of morals, must of course be various. This difference will naturally be increased in some instances, and lessened in others, by the clashing of opposite interests, by individual exertion, and by the occasional influence of party. Those, who are most similar, will naturally unite in little bands; the more strongly opposed because they come frequently into the field of contention, and are thus habitually arrayed against each other. Local causes, and those contemptible, often edge their animosity, and excite new contentions. Most of them, however, become at length weary of so unprofitable and tedious a mode of life; of debates, which prevent the existence of good neighbourhood; and of contentions, which waste their time and money, and preclude every thought of a religious nature, and, assuming more moderation, either sink into general listlessness, or rise to a sober, rational, and respectable character.

Westmoreland lies immediately North of Chesterfield; and was originally called *the Great Meadow*, from a considerable interval

on the opposite side of Connecticut river. It was also often styled No. 2; being the second in a range of townships, granted on the Connecticut at the same time; of which Chesterfield was No. 1: Walpole, No. 3: and Charlestown, No. 4.

This township is less mountainous than Chesterfield; and along Connecticut river the hills, as seen from the opposite bank, are beautiful. The soil is excellent; and, what may hereafter prove a misfortune to the inhabitants, it contains very little land, which is incapable of cultivation. Few farmers have forecast enough to preserve lands in a forested state. Almost all townships, which, throughout, are of a rich soil, experience ultimately a scarcity of timber, and fuel. The people of Westmoreland will exhibit more than common prudence, if they avoid this evil. At present, their farms and houses give undoubted proofs of prosperous industry. A small village surrounds the church in the centre of this township.

Westmoreland was incorporated in 1752. The first settlements here, and in the other three townships of this range, were begun several years earlier; but, being exposed to the ravages of the Indians, were few, and scarcely progressive, until after the conquest of Canada. The early settlers were several times attacked by them, and various mischief was done, but of no great magnitude. In one of their excursions they killed William Phipps, the first husband of Mrs. Howe; and in another, carried Nehemiah Howe, the father of her second husband, a captive to Canada, where he died.

Westmoreland, in 1775, contained 758 inhabitants; in 1790, 2,018; in 1800, 2,066; and in 1810, 1,937. These are formed into one Presbyterian, and two Baptist, congregations. The township began to be settled in earnest in 1774.

Walpole is the Northern boundary of Westmoreland; and was originally called Bellows-town, from Colonel Bellows, its first and principal planter. This gentleman stationed himself here in early life, as a commissary, for that part of the army, which, during the war of 1755 was posted in this quarter. Under the protection of a small fort, which also bore his name, and with the assistance

of a few hardy companions, he was enabled to keep his ground through the war. As he was the first planter, a man equally sagacious and industrious, and furnished by his commissariat with considerable advantages for acquiring property; he became possessed of a large landed estate; and left his family in opulent circumstances. Some of his descendants, particularly his son, Major-General Bellows, have been persons of much respectability. The remarkable falls in Connecticut river have taken his name, and will probably convey it down to distant generations.

Walpole consists of a level tract along the river, principally composed of two beautiful intervals, (originally the property of Colonel Bellows,) and a lofty hill, a part of the range of Mount Toby: the highest parts of which are not less than seven or eight hundred feet above the surface of the river. The soil of this eminence is good grazing ground, and is universally under cultivation. The farmers appear generally to be in easy circumstance.

The town of Walpole stands at the foot of this hill on a plain; the margin of one of these intervals. The principal street runs North and South; and is bordered on both sides by a collection of well appearing houses, stores, and shops. A turnpike road from Boston passes through this village; and crossing the river at Bellows-Falls, passes over the Green Mountains to Rutland in Vermont; and thence, through Middlebury and Burlington, by Lake Champlain, to Montreal. As this is the principal channel of communication between Boston, and the country on the North-West, the travelling and transportation on it are great. From these circumstances, this village has become the seat of considerable business. It contains a printing office and a book-store.

I am, Sir, yours, &c.

## LETTER VI.

Bellows-Falls—Cavities worn in the rocks by the river—Canal—The first bridge over Connecticut River erected at this place by Colonel Enoch Hale—Governour's Meadow.

*Dear Sir,*

MONDAY, September 25th, we set out for Charlestown, accompanied by Col. Tyler of Guilford in Vermont; who politely offered to point out to us whatever was interesting at Bellows-Falls, three miles North of the village of Walpole. These are the falls, so fancifully described by Peters in that collection of extravagancies, which he has been pleased to style, "the History of Connecticut." They are certainly an interesting natural curiosity; although we did not find the water beneath them so hard, as to be impervious to an iron crow. They are formed by four successive rifts, with the same number of rapids; and extend in a straight line three fourths of a mile; or, if measured on the circular course of the river, seven eighths. In this estimate I include that part of the river, which lies between the two ends of the Canal, to be described hereafter. All these rifts run from the foot of the Fall Mountain; the base of which, at this spot, terminates about forty rods Eastward of the river. The rocks are very hard grey granite. In the Northern and middle rifts there is nothing remarkable; but the Southern has long been an object of peculiar attention. The waters of the Connecticut, which both above and below the falls are forty rods in breadth, are here contracted to the narrow compass of twenty feet; and, when the stream is very low, it is said, within that of six. The rapidity of the current may be conjectured from this fact.

An inquisitive traveller, while inspecting this ground, will want no argument to convince him, that the river, anciently had its channel about fifty rods, where the distance is greatest, Westward of the place where it now runs. Here a canal is dug in its former bed, to facilitate the transportation of boats around these

falls. The bed of rocks, after crossing the present channel, takes a South-Western direction towards the lower end of the canal. Originally, the bed of the river was from fifteen to twenty feet higher than it is at present; as is unanswerably evident from the great number of excavations, which it formerly wrought out in the rocks, chiefly on the Western bank, which are now from ten to fifteen feet above the highest present water-mark. The river now, is often fuller than it probably ever was, before the country above was cleared of its forests: the snows in open ground melting much more suddenly, and forming much greater freshets, than in forested ground. The river cannot, therefore, have risen to the height of these excavations by having a greater supply of water. Besides, excavations so deep, so large, and wrought in rocks so hard, show with absolute certainty, that the river ran at this level often, and for a long period: a fact, which no possible sources of its waters could have been the means of accomplishing, had it customarily flowed at its present level.

These cavities are very numerous, both above and below the bridge. They are, also, of various forms; from that of a shallow dish to that of an iron pot, that of a barrel; and in one instance, that of an inverted pear; and of various sizes, from the capacity of a pint bowl to that of perhaps two hogsheads. Their greatest depths we could not accurately estimate; because those which were deepest, as well as many others, were partially filled with water, gravel, and stones.

From these cavities, and others like them, and, generally, from the depredations, made by falls of water upon the rocks, over which they fell, that class of Infidels, who have discernment exactly fitted to perceive, candour enough to love, and industry sufficient to point out, petty objections against Revelation, have with no small triumph found, here, in their own opinion, means of disproving the date, assigned to the creation by Moses. An argument, founded, as this is, on arithmetical computation, requires, that the means of computing should be within the reach of him, by whom the argument is adduced. Had these gentlemen taken the pains to examine the subject on the spot; they

would have found, that neither here, nor in any other place of the like nature, are there any possible means of such a computation; and that, therefore, the argument is totally destitute of foundation. The rocks are in some places harder than in others; the water some years rises oftener, and higher, than in others, and is sometimes more replenished with grit. The gravel and stones exist in greater quantities; the stones are larger, have sharper angles, and are of a harder consistence. From these facts it is evident, that nothing like regularity can exist in this operation of nature; nothing which can present materials for any calculation.

The manner, in which these cavities commenced, and how the stones and gravel, by which they are worn, are retained in the same spot before the rock is to a considerable degree hollowed out, it seems not very easy to determine. The best solution of the difficulty, which I am able to give, is the following. The rocks, although generally of a form approaching towards convexity, are in some places flat, and in others in a small degree concave. There are in all rivers, especially where they are most agitated, innumerable little circular eddies, or whirlpools. Whenever one of these exists immediately over such a spot, having gravel and stones lying on it, they are driven around in exact conformity to the direction of the water, and are retained in their place by its circular force. In this manner, they grind the rock until they have worn a concavity; whose figure will ever afterwards create a similar whirlpool within its limits.

All the stones and gravel, which we saw in these cavities, had their angles entirely worn off by the attrition.

On one of the rocks, lying in the river below the bridge, we saw two rude Indian attempts at sculpture. They were very coarse copies of the human face: a circular figure, cut in the rock, serving for the outline; two round holes for the eyes; and an elliptical one for the mouth. For what purpose they were made in this place we were unable to divine. They are not visible, except when the water is low.

I have observed that the bed of the river is lower than it was formerly. This change has been chiefly accomplished by the washing away of the earth, gravel, and stones, which were of such a size, as to yield to the force of the current. In consequence of this process, the stones and rocks, of a larger size, have gradually subsided. Even these, indeed, have been partially worn: but not so as to contribute perceptibly to any alteration in the channel. Where the bed of a river is a stratum of slate, or limestone; very great changes often take place, from the attrition of the stream, and the influence of the atmosphere; but these rocks are of too firm a texture to be greatly affected, by the efficacy of either.

On the Western side of the river a canal was begun, and, in 1797, about two thirds finished, for the purpose of conveying boats around these falls. Its length is three fourths of a mile; its breadth at the bottom eighteen feet, at the top sixty; and its depth twenty. The expense, at which it is dug, exclusive of the passage through the rocks, mentioned above, is thirty dollars per rod. Through these rocks a way has been blown, with great expense. The whole sum, already laid out, as we were informed, is \$45,000. A considerable addition must be made to this, before the works can be completed.

In September 1803, October 1806, and May 1810, I visited this spot;\* and in all these instances found the canal answering, in a good degree, the purpose, for which it was made. Boats, of the size formerly mentioned in the account of the South Hadley canal, are safely, and easily, conveyed through it; as are also rafts of boards and timber. The water is thrown into it by a dam, which crosses the river a little below its upper entrance. The whole number of locks, including a guard lock, is seven; six of these raise, or lower, the boats seven feet four inches, each; or forty-four feet: the whole descent of the river at this place. In digging the canal the proprietors have availed themselves of the ancient bed of the river; and thus have saved a prodigious

\* And since in October 1812, and October 1813.

mass of labour. Indeed, without this advantage the attempt in all probability would not have been made.

Two saw-mills, a grist-mill, a paper-mill, and a carding-machine, are built near the lower end of the canal. All these are esteemed valuable property ; as they stand in perfect safety from the ravages of the river, and are furnished with a never failing supply of water. The grist-mill, particularly, is considered as the best, and most profitable, in this part of the country.\* It is questionable whether the canal will soon become proportionally profitable to the proprietors ; although it cannot fail to be of considerable use to the community.

These works were projected, and executed, by William Page, Esq. of Charlestown. The capital, as I believe, was chiefly furnished by Mr. Atkinson ; a merchant in the city of New-York.

There is a small hamlet, containing a few houses and stores, on the Western side of the canal, and on the island between that and the river.

Just below the principal fall, was built in the year 1785, and in the year 1797 was still standing, the first bridge, which was ever erected over Connecticut river. The builder was Colonel Enoch Hale. When he first formed the design, its practicability was generally denied ; and the undertaker laughed at for seriously proposing so romantic a project. He was not, however, discouraged : but, meeting the common opinion, and the ridicule with which it was expressed, with that firmness, which is indispensable to the success of new and difficult efforts, he began, and completed, the work in the year 1785. The spot was granted to him for this purpose by the Legislature of New-Hampshire, and the toll established by law. The project has been eminently useful to the public ; but was not very profitable to himself. The want of a good road across the country prevented a great part of that travelling, which has since been produced by the establishment of the turnpike, last mentioned. He was, therefore, obliged to sell his property, without reaping from it that reward, which a generous mind instinctively wishes to ingenuity, and public spirit.

\*These works were consumed by fire in 1811.

How often do the authors of ingenious, and honourable undertakings experience this painful retribution !

Colonel Hale was probably the first man, who seriously realized the practicability of erecting a bridge over this river. What is much more, he was the first man, who proved that it could be done. It is curious to mark the progress of opinion concerning subjects, originally so difficult, as scarcely to become topics of reflection, and yet so interesting, as to be objects of general desire. This river, at Lancaster, one hundred and thirty-three miles North of this bridge, is thirty rods in breadth, and of considerable depth. The ice, with which it is covered every winter, is thick, and strong; and the freshets are at times sudden, and not unfrequently, so great, as to raise its waters from ten to twenty-five feet above their common level, and to spread them in various places, from half a mile, to a mile and a half, or two miles, in breadth, over the intervals on its borders. Before a bridge had been actually built over it, therefore, it was a very natural conclusion, that no structure of this kind, which the wealth of the inhabitants could conveniently furnish, would be of sufficient strength to sustain the occasional violence of the stream. I have often heard this subject mentioned in the early periods of my life; and always, as a thing, which was indeed extremely desirable, but absolutely impracticable; an object of ardent wishes, but of no expectations. In such a situation, the man, who with comprehensive views discerning all the difficulties, sees also the means of surmounting them; whose energy not only prompts him to adventure, but invigorates him to overcome; and whose public spirit quickens him to useful enterprises, from which his heavy minded, and parsimonious, neighbours shrink with self-gratulation; begins, and in a sense creates, all the future success of such generous efforts; and deserves a grateful and permanent remembrance as a public benefactor.

Doctor Belknap, speaking of this bridge in 1792, says, "This is the only bridge across Connecticut river, but it is in contemplation to erect one thirty-six miles above, at the middle bar of White river fall." There are now thirteen bridges over this

river.\* The commencement of difficult enterprises is usually entered upon very slowly, and reluctantly: their progress is often rapid beyond the most sanguine expectation.

In the year 1803, the bridge erected by Colonel Hale, at the expense of twenty-seven hundred dollars, had been taken down; and a new one built, under the direction of Mr. Geyer, a merchant of Boston, and the present proprietor. I was not a little pleased with this structure. It is neat, light, and simple; and yet possesses great strength. Two sets of very long, and very firm, braces, fastened near the centre, extend to the rocks on both sides of the river; and leave the passage for the water and the ice, entirely clear, and the bridge perfectly secure. Its figure is a very obtuse arch. Wherever the ground will admit of this construction, it is the best within my knowledge; and combines neatness and strength with the least possible expense.

This bridge is said to be valuable property.

A few rods from it, on the Eastern bank, Mr. Geyer has erected a large elegant mansion, fronted towards the river, with handsome appendages.† At a small distance from this house ascends, perpendicularly, the Fall mountain; a bald, rocky, gloomy precipice, rising about six hundred feet above the surface of the river. To an eye, surveying this mountain, it seems scarcely possible, that its torrents, or even its rocks, should not at some time or other intrude, very inconveniently, upon the possessions of this gentleman.

This mountain is familiarly known by the name of *the Governour's Meadow*: an appellation, which it is said to have derived from the following incident. Colonel Bellows applied to Benning Wentworth, Esq. formerly Governour of New-Hampshire, to grant him a tract of land in Walpole. The Governour had been informed by Theodore Atkinson, Esq. then Secretary of the Province, that Bellows was a shrewd man, and must be watched with peculiar caution in cases of this nature. With this fact Bellows

\* The number is since increased to eighteen.

† There are two good houses on the Western side, belonging to the Hon. William Hall, one of them very handsome.

had been made acquainted ; and knew perfectly well how to turn it to his advantage. Accordingly, when he came to solicit the grant, he requested, that it might be located in the North-Western quarter of the township ; that is, on the summit of this ragged mountain. The Governour had been informed by Mr. Atkinson, that there were very fine meadows, or intervals, in this township ; and took it for granted, that these only would be the objects of an application from so sagacious a suitor. He therefore told Colonel Bellows, that he could not grant him the land in question ; since he understood that it consisted of very valuable meadows ; but subjoined, that he would permit him to take an equal tract in any other part of the township. Bellows accordingly yielded to necessity ; and consented to locate his grant agreeably to the Governour's proposal. In this manner, it is said, he became the proprietor, either partially, or wholly, of those beautiful intervals, which have been already described, and which were the very lands, intentionally reserved by the Governour for himself.

Colonel Bellows, however, earned his fortune very dearly. For a long time he was exposed, without any other defence than a small fort, with a trifling garrison, to the incursions of the Canadians and savages. During the season of war, every day of his life was a day of hazard ; and every step, which he took out of his fortress, encircled by peril. In 1755, a party of Indians from St. Francis invaded Walpole ; killed two men ; and took possession of the fort. Bellows was abroad. On his return, with twenty men he met fifty of the savages ; fought his way through them ; killed several ; and recovered the fort ; without losing a man. This fact may serye as a picture of his life until after the conquest of Canada.

These falls, though much less magnificent than those of South-Hadley, have engrossed much more the attention of travellers. To see a river, usually forty rods wide, and at all times deep enough to convey boats, carrying twenty-five tons, run through a channel, twenty feet in breadth, is equally singular and surprising. The impression, made by this extraordinary fact, is not

a little increased by the surrounding objects. The rapids above and below, the canal, the mills, the stores, and the neighbouring hamlet; the rocks on both shores, piled together in absolute confusion, and fantastically worn into such a variety of forms; the very bridge, on which the traveller stands; the beautiful house of Mr. Geyer; and the wild and rugged mountain, hanging over it with its awful precipices; leave an impression on the mind, which it will be impossible for him to forget in the future periods of life.

I am, Sir, yours, &c.

561953

## LETTER VII.

Charlestown—Indian Depredations—Gallant conduct of Captain Phineas Stevens.

*Dear Sir,*

HAVING surveyed the falls, and dined at an inn on the Western side of the canal, we proceeded to Charlestown, nine miles: from Walpole twelve. This is a very pleasant ride. The road is excellent. The Fall mountain, ascending immediately on the right, accompanies the road almost to Charlestown. On the left it lies partly on the river, and partly on the border of rich and elegant intervals. On the West, the prospect is limited by a succession of rude hills. This union of soft and rude, of solemn and sprightly, scenery is more interesting than a person, who has not been on the spot, can easily imagine.

Charlestown, anciently named No. 4, is bounded on the North by Claremont; on the East by Acworth, and Olmsted; on the South by Walpole; and on the West by Connecticut river. It was incorporated in 1753. A fort was built here in 1743; deserted in 1745; and re-occupied in 1746. Except two short periods in the winters of 1746 and 1747, a garrison was continued in it until 1763.\* The settlements, however, were few until after the last date.

The town is built on a plain, pleasantly elevated above a handsome interval, and terminating at the foot of the Fall mountain; which here recedes towards the North-East, and is no other than a continuation of the range of Mount Toby. The principal street lies parallel with the river; and is accompanied by another, a little Eastward, which has the same direction. These are met at right angles by two others. The houses are generally neat; several of them are very good; and the whole appearance of the town is interesting. The situation is, I think, particularly pleasant. The verdure is fine; the orchards are thrifty; the intervals, containing 1,750 acres, are rich, and handsome. A rough

\* It is still standing.

mountain, by the name of Skitchawaug, furnishes with its shaggy sides a good contrast, on the North-West, to the smiling elegance of the scenery below it; and at the distance of sixteen miles Aschutney ascends in the Northern point with great magnificence.

The inhabitants of Charlestown constitute one congregation; but, as they are scattered in their settlements to the Northern extremity of the township, they have erected two churches; one in the town; the other Northward of it about three miles. In the latter, divine service is celebrated, one Sabbath in three, by such of the inhabitants, as cannot conveniently meet in the former.\*

Charlestown, as I have heretofore observed, is a half-shire town. Both the churches, and the court-house, are decent buildings.

This town was repeatedly attacked by the Canadians and Indians. In May, 1746, they assaulted it in considerable numbers, and killed one man; but were driven off by the spirited behaviour of Major Josiah Willard, at the head of a small party of soldiers. On the 24th of the same month they ambushed twenty soldiers, as they went out to view the place, where the man was slain; and fired upon them. At this time the fort was commanded by Captain Phineas Stevens; a partizan, of great gallantry. Upon the first notice of their danger, he marched to their relief; and found the enemy attempting to cut off their retreat to the fort. An action ensued. The savages killed three of Stevens's men; took one; lost five of their own; and fled. On the 19th of June following, as Captain Stevens and Captain Brown, with about fifty men, were going from the fort to the interval, which lies Westward of it, their dogs discovered an Indian ambush. Stevens immediately attacked them; and, after a sharp skirmish, drove them into a swamp, at some distance. He lost one man; and killed several of the enemy. On the 3d of August these people, after having assaulted the garrison for several days in vain, killed a man by the name of Phillips; burned several buildings; and destroyed a number of cattle.

\* There are now two Congregations. (1813.)

In the beginning of the winter of 1747 the fort was deserted. The Legislature of Massachusetts Bay, being apprized of the importance of this and other military posts along Connecticut river, ordered out a number of men, to serve as garrisons, and to scour the country. These men were appropriately called Rangers.

In March 1747, Captain Stevens came, with a company of thirty rangers, to this town; and, finding the fort entire, determined to garrison it. Soon after, it was attacked by a large body of Canadians and savages, under the command of Monsieur Debelinì, who attempted to set it on fire by kindling the fences and out-works, and shooting into it a great number of burning arrows. This mode of assault the enemy continued through two days; but were completely defeated in their design by the activity, and prudence, of Stevens. The next morning Debelinì demanded a parley; and sent an officer into the fort, with a proposition, that the garrison should lay down their arms, and be conveyed to Montreal as prisoners of war; or, as an alternative, that the two commanders should meet, and confer on the subject. To the latter proposal Stevens agreed. Debelinì opened the meeting by declaring, that, if Stevens should reject his former proposition, or should kill one of his men, he would storm the fort, and put the whole garrison to death. To this formidable declaration Stevens replied, that it was his duty, and his determination, to defend the fort until he found the Frenchman able to execute his threatenings. Debelinì then told him to go, and see whether his men would dare to second him. Stevens went back to the fort, and put the question to his men; who answered with a single voice, that they would fight to the last. This answer he immediately announced to Debelinì. The Frenchman had already prepared a wheel carriage, loaded with dry faggots, with which he intended to set fire to the fort. Upon receiving this answer, therefore, he ordered some of his men to kindle the faggots, and push the machine up to the fort; while the rest renewed the attack. But he found himself unable either to burn the fort, or terrify the garrison. The assault, however, was continued all that day. Sorely mortified with his ill success, the Frenchman the next morning

proposed a second cessation of arms. It was granted. He then sent in two Indians with a flag; and offered to withdraw, if Stevens would sell him some provisions. This Stevens refused to do; but offered him five bushels of corn for every captive, whom Debelinè would promise to send him from Canada; leaving hostages for the performance of his promise. The Frenchman in a rage ordered his men to fire a few muskets at the fort; and marched off. In this gallant defence not one of Stevens's men was killed; and only two were wounded. Sir Charles Knowles, then at Boston, was so well pleased with Stevens's conduct, that he sent him an elegant sword. From this gentleman Charlestown took its name.

Charlestown in 1775 contained 594 inhabitants; in 1790, 1,098; in 1800, 1,364; and, in 1810, 1,501.

I am, Sir, yours, &c.

## LETTER VIII.

Claremont—Cornish—Windsor—Aschutney—Luminous spot on the mountain—  
Hartland—Plainfield—Lebanon—Lebanon-Falls.

*Dear Sir,*

WE were detained on Tuesday, September 26th, by the rain. One of the courts was in session; and several gentlemen of the bar lodged at the inn. One of these, Colonel M. a respectable man, informed me, that Colonel Maclain, who, as you may remember, was seized as an agent of the French Government in Canada, hinted to him, a part of his plot some time before Maclain was apprehended; and among other things told him, that, if he wished to have a Colonel's commission under the French Government, as an actor in this business, it might be easily obtained.

On Wednesday, September 27th, we left Charlestown in the morning; and rode through Claremont, and Cornish, in New-Hampshire; Windsor, and Hartland, in Vermont; a corner of Plainfield, and the whole breadth of Lebanon, in New-Hampshire, to Dartmouth College, thirty-six miles. We found the road good.

Claremont is a fine, undulating country; covered with a rich gravelly loam, converted into the best meadows, and pastures. The hills are sloping acclivities, crowned with elegant summits. The township is chiefly distributed into plantations. The houses in many instances are good; and the indications of prosperity abundant. Claremont is one of the wealthiest towns in this County; and in its soil inferiour to very few on the river.

When we left Charlestown, we quitted the ground, which was formerly the scene of Indian ravages. All the country above this town in New-Hampshire, and above Brattleborough in Vermont, was almost an absolute wilderness until after the peace of Paris. An attempt, indeed, was once made to begin a settlement at Newbury; but the Indians opposing it, it was given up. After that time, the whole region was converted into a fruitful field, with a rapidity, which has rarely been paralleled.

Claremont was incorporated in 1764 ; and contained, in 1675, 523 inhabitants ; in 1790, 1,435 ; in 1800, 1,889 ; and in 1810, 2,094. These form two Congregations ; one a Presbyterian ; the other an Episcopal.

Of Cornish we saw little. On Sugar river, which runs between this township and Claremont, there is a long chain of handsome Intervals, lying in one, perhaps in both, of these towns. The road, here, lies along the Connecticut : and the hills approach so near to that river, as to shut out the prospect of the interior. Since this journey was taken, a decent Episcopal church has been erected here, almost on the bank. The Presbyterian church in Claremont is also handsome.

Cornish was incorporated in 1763 ; and contained, in 1675, 309 inhabitants ; in 1790, 982 ; in 1800, 1,268 ; and, in 1810, 1,606 : chiefly included in one congregation.

We crossed the Connecticut between Cornish and Windsor on a bridge, consisting of two arches, built exactly on the plan of the Haverhill bridge, formerly described. The chord of these arches is 144 feet ; and the length of the bridge 521. The expense of erecting it was 20,000 dollars.

Windsor is a flourishing and beautiful town ; the shire town of the County of Windsor ; and plainly superiour to any other in the state of Vermont, on the Eastern side of the Green Mountains. It is seventeen miles North of Charlestown by the shortest road ; eighteen by that, which we took ; one hundred and sixty-seven from New-Haven ; about one hundred and nine from Boston ; and about one hundred and five from Portsmouth. It is divided by a North and South line into two parishes. The Eastern, only, is the subject of my observations.

This parish is naturally divided into three parts : a flat near the river ; a lofty mountain, called Aschutney ; and a collection of hills, filling a principal part of its extent. The flat consists principally of an Interval, extending along the river four and a half miles ; in breadth from one quarter to one half, and three quarters of a mile. The mountain rises at a small distance from the river ; and is separated from it by a plain, which may be con-

sidered as its base. Above this plain, after ascending a moderate acclivity, lies another : both of them handsome grounds, and the latter finely prospective. On it are built a considerable number of good houses. The great body of the town, however, consists of a single street, parallel with the river ; not far from two miles in length, and lying partly on the lower plain, and partly on the Interval. The houses in Windsor are generally good ; and several of them are built in a handsome style. Very few inland towns in New-England appear with equal advantage. The court-house, which stands on the North-Eastern corner of the upper plain, is an ordinary building : the church, which stands on its declivity, is large and well appearing.

Windsor contains a considerable number of stores ; and among others one or two bookstores. Here, also are two printing offices. More mercantile and mechanical business is done here, than in any town on the river, North of Massachusetts ; and it is said to be increasing.

On the upper plain the Legislature of Vermont have stationed their state prison. It is a large and well appearing structure, built of grey granite ; furnished abundantly in this neighbourhood, and extremely well fitted for such a purpose. It is very firm : and yet capable of being split into pieces of any shape, and of any size, which can conveniently be employed in building. This work cost, it is said, \$36,813 78 cents ;\* and is destined for the reception of persons, guilty of felonies, which are not made capital.

The Interval, here, is excellent. The uplands, where they are moist, are well suited to meadow and pasturages ; and where they are dry to the various kinds of grain.

*Aschutney*, it is said, signifies *the three Brothers* : the name being supposed to indicate the three principal summits of this mountain. As seen in most directions, it is, however, a single conical eminence, with several inferiour summits, which are also conical. From its whole appearance I was induced to suspect that at some former period it had been volcanic ; and made several enquiries concerning this subject. A respectable inhabitant of Windsor in-

\* Report of building Committee, in the *Washingtonian*, Dec. 16, 1810.

formed me that a Mr. West, one of the first planters, who was living in 1803, and of a fair reputation, declared to him, that in the early periods of the settlement he saw flame, at several times, and those considerably distant, ascend from the summit of this mountain. Fires are sometimes kindled on mountains by lightning, and sometimes by huntsmen; and the fires, kindled in either manner, will in some instances continue to burn for several days. It would seem, however, that the fires seen by Mr. West, at least in one instance, cannot have been produced by either of these causes; for the time was the month of March; and the snow on the mountain was three feet deep.

Clouds usually envelope the summit of Aschutney for some time before a rain; and rain commonly commences on the mountain before it descends on the subjacent country. Of both these facts I have been an eye witness. On the 10th of October, 1803, I was riding from Dartmouth College to Charlestown. A strong South wind blew during the whole day. The sky was overcast, and the clouds, flying low, impinged at times against the sides of the mountain and covered its top. In these clouds, at a small distance from the summit, and in such a direction as to make an angle of about  $25^{\circ}$  with the perpendicular height of the mountain, appeared a luminous spot, from ten o'clock in the morning to four, in the afternoon; the whole period, during which the mountain was within our view. All this time the clouds wore a misty appearance, every where nearly uniform; and moved with great rapidity. Yet the luminous spot continued in exactly the same position; and scarcely at all changed its appearance. In a few instances, the clouds were so thin, that the beams of the sun were faintly but distinctly seen on the side of the mountain. Generally, they were intercepted. As the clouds changed their position every moment; as the sun, during this time, passed over ninety degrees of the heavens; as, when the spot was first seen, we were perhaps eight or ten miles North, and when it was last seen about the same distance South of the mountain; I could think of no satisfactory reason, why the position, and appearance of the spot continued unchanged.

I saw the same phenomenon, October 23d, 1804, in the neighbourhood of Taghkannuc.

Aschutney is said to have been measured by James Winthrop, Esq. The height, as given by Doctor Morse, is 1732 feet above the surface of the river and 2031 above that of the ocean. The real height, as it has since been geometrically measured by the Rev. Bancroft Fowler, the present minister of Windsor, is 1929 feet above the river.

The inhabitants of this town have, from an early period, been greatly divided with regard to their ecclesiastical affairs. So far did these contentions proceed at one time, that they settled two ministers, when they were ill able to support one. Both these, as might have been foreseen, were after a short time removed; and a greater degree of harmony has sprung from a greater degree of moderation among the inhabitants. It is ardently to be wished, that christian congregations could more clearly understand, and more deeply feel, that interesting declaration of St. James, "The fruit of righteousness is sown in peace of them that make peace." Fewer families would, I believe, lose the way to heaven by quarrelling about its direction.

The scenery in, and about this town has many attractions to the eye of the traveller. The rough bank on the opposite side of the river, the river itself, the luxuriant interval, the plains, the town, the hills, and the magnificent mountain, form a groupe of fine objects, on which no eye, delighted with the beauties of nature, can fail to rest with peculiar pleasure.

Windsor, in 1790, contained 1,542 inhabitants; in 1800, 2,211; and in 1810, 2,757.

We dined at Windsor; and finished our journey in the afternoon. The road from Windsor to Dartmouth College passes through the skirt of Hartland; in which we saw little that was interesting, except a handsome house, and beautiful farm, at a little distance; and a brook, called Lull's brook, from a person of that name, settled on its border; which on the right side of the road has cut a channel in the earth, perpendicularly and wildly, forty or fifty feet deep. In the chasm mills are erected, which

the stream, a perpetual cascade, turns very briskly. The mills, if I do not misrecollect, are invisible above the common surface.

At a small distance above this brook runs Waterquechee river, which joins the Connecticut at the ferry. About a quarter of a mile before this junction, the Waterquechee, with a stream more than two hundred feet wide, pours down a semicircular ridge of rocks, about forty feet in height. The descent varies sufficiently from perpendicularity, and is so broken as to throw the water into a great variety of the most romantic and elegant figures. It presents very little of the force and grandeur of a cataract, but all the beauties of a wide-spread and most elegant cascade. I saw it afterwards, when the river was full; it had then become a mere sheet, and, although a fine object still, the fascination had vanished.

Hartland is numerously settled on the hills; and contained, in 1790, 1,652 inhabitants; in 1800, 1,960; and, in 1810, 2,352.

Plainfield exhibits on this road nothing but two or three houses, with little farms around them, and a continued forest through the remaining distance. The settlements lie on the Eastern side of the hills; and were to us invisible. In 1790, it contained 1,024 inhabitants; in 1800, 1,435; and, in 1810, 1,463.

In Lebanon there is a considerable number of settlements on the road; composing a hamlet upon a small plain, bordering the river. At the Northern extremity of this plain, appear, in an advantageous point of view, Lebanon falls; formed by the brow of a hill, which is its boundary. These falls are handsome. The breadth of the river is about two hundred feet; and the descent, in three fourths of a mile, about thirty feet: twenty of which are occupied by the Southernmost ledge of rocks where the water pours wildly, and romantically, into a deep basin below.

After ascending the brow of this hill, we found another plain, extending several miles to the North, of an irregular surface, and beautifully covered with young white pines. Unhappily, a great part of them have been since cut down. There is reason to fear that this noblest of all vegetable productions will be unknown in

its proper size, and splendour, to the future inhabitants of New-England.

Lebanon is the Southernmost town in the County of Grafton; a County, comprising the whole Northern end of New-Hampshire, and about one third of the State.\* In 1775, Lebanon contained 347 inhabitants; in 1790, 1,180; in 1800, 1,574; and, in 1810, 1,808.

I am, Sir, yours, &c.

\* It has since been divided into two Counties. The Northern division is called the County of Coos.—*Pub.*

## LETTER IX.

Origin of Dartmouth College—Rev. Sampson Occom—Funds of the College—Its number of students and officers—Its course of studies and buildings—Extreme difficulty of educating Indian youth—Dartmouth—Hanover.

*Dear Sir,*

DARTMOUTH College stands on the plain last mentioned, about two miles from its brow, or from Lebanon fall; and half a mile East of Connecticut River. It is one hundred and thirty-three miles from Boston, and one hundred and eighty-five from New-Haven. It derived its name from William, Earl of Dartmouth; one of its most considerable benefactors; and was founded, in the year 1769, by the vigilant and persevering industry of the Rev. Eleazar Wheelock, D. D. formerly a minister of the third parish of Lebanon in Connecticut. Here, this gentleman had before set up an Academy, intended particularly for missionaries, who were to spread the Gospel among the Western Indians. In this school, several of the Aborigines were fitted to enter upon a Collegiate education, and expectations were extensively formed, that by their assistance their countrymen might be persuaded to embrace Christianity. Several of them were promising youths; and by the proper trials were found to possess the average share of genius, and to acquire learning, and science, with the same facility, as their white companions. Several of them were placed in Colleges; and received the usual degrees. Almost all of them however, renounced, ultimately, the advantages which they had acquired; and returned to the grossness of savage life.

One of them, a Mohegan, born in the township of Montville, advanced so far in knowledge, and behaved so well, that he received from the Presbytery of Suffolk, on Long-Island, a regular ordination. This man was the celebrated Sampson Occom. Soon after, he became a Missionary; and preached for some time to the Indians. From them, he at length returned; and began to preach in this country to crowded, and astonished audiences.

Few persons had believed, that an Indian could preach with intelligence, and propriety; and multitudes regarded the fact with a kind of rapture. I heard Mr. Occom twice. His discourses, though not proofs of superiour talents, were decent; and his utterance in some degree eloquent. His character at times laboured under some imputations. Yet there are good reasons to believe, that most, if not all, of them were unfounded; and there is satisfactory evidence, that he was a man of piety. During several years (the last of his life,) he lived within the bounds of the Presbytery of Albany. By a respectable Clergyman, belonging to that body, I have been informed, that he was regularly received into their number; that he was esteemed by them a good man, and a useful minister; that he was uncensurable in his life; and that he was, lamented, and honoured at his death.

Not long after Mr. Occom began to preach, he was sent to England by Dr. Wheelock, in company with a Mr. Whitaker, to solicit benefactions for a College; to be erected in the wilderness, and devoted principally to the education of Indian youth. No project could have been more happily devised. The appearance of Mr. Occom in England excited very strong sensations in the minds of great multitudes; particularly of the pious and benevolent. Proof was here furnished, that an Indian could maintain so unblamable a life, and acquire such a degree of knowledge, as to be judged worthy of receiving a regular ordination; and could preach in such a manner, as to engage the attention of an English audience. All doubt on this subject was now dispelled; and the most obstinate unbelief put to silence.

Benefactions were solicited, therefore, with a success, which outran the most sanguine expectations. Among the patrons was the King: and the royal example was followed by several persons of distinction. A large sum of money was collected, and forwarded to America; where the list of benefactors was considerably increased.

With this money Dr. Wheelock set himself immediately about the design of erecting a College, intended especially for the education of Indians, and of Missionaries to the Indians. Other stu-

dents, however, were to share in the benefits of the Seminary without distinction. The object, which first demanded attention, was the location of the College. Health, the fertility of the surrounding country, convenient communication with the Indians, the prospect of obtaining English students, and the hope of donations from the State, in which the Institution should be fixed, were, all, considerations, which had their share of influence. By these, differently, the attention of the principal was turned successively to Pennsylvania, New-York, and New-Hampshire. At length the township of Hanover, in the last of these Provinces, was pitched upon; as being supposed to combine more advantages, than any other place contemplated.

Hanover was incorporated in 1761. The College was placed here in 1769. At this time, as you will naturally suppose from the observations, so often made in these letters, the whole of this region was almost a mere wilderness. In the county of Grafton, containing fifty townships, and sufficient land for thirty or forty more, there were, in the year 1775, but 3,945 inhabitants: and probably half of these planted themselves between 1769 and 1775. In the year 1800 there were in the same county 23,093. At the former of these periods Vermont was chiefly a forest. Hanover itself, in 1775, had a population of 434 only. Dr. Wheelock, therefore, looked chiefly, and let me add safely, to the progressive and rapid settlement of these countries, for the necessary number of English students. Vermont was then regarded as a part of New-Hampshire; and in customary language was styled *the New-Hampshire grants*. At this period also, neither of these countries could boast of any seminary, superiour to an ordinary grammar school.

The region, in which this College was established, is very healthy, and fertile. Nor was it inconveniently situated for intercourse with the Indian nations. The inhabitants of Hanover presented to the College 1,200 acres of valuable land: and the State endowed it with about 78,000 more, in several successive grants; of which 1,200 are within the limits of Vermont. These lands may be generally considered as increasing in their value.

The largest tract, however, containing 42,000 acres, and lying immediately Northward of the town of Stuart on Connecticut river, and above the forty-fifth degree of North latitude, is to a considerable extent rough, broken, and incapable of cultivation. Not more than one half of this tract will probably be of any serious importance to the Institution. Other donations, of a moderate amount, have been occasionally made to it by the State.

In the year 1770, Dr. Wheelock, whose zeal and perseverance peculiarly qualified him to become, in such circumstances, the founder of such a Seminary, had the satisfaction to see the College commencing its operations under his auspices. At first, the number of students was of course small: but, as was easily foreseen, regularly increased. For a series of years the average has been from one hundred and forty to one hundred and fifty. In the year 1771, at the first Commencement, four, only, received the degree of A. B.\*

The students are usually about one hundred and fifty in number; and as in the other New-England Colleges, are divided into four classes. The freshmen study the learned Languages, the rudiments of speaking and writing, and the elements of Mathematics. The sophomores beside the Languages, and Mathematics, study also Geography, and Logic. The junior sophisters, beside the Languages, are employed in Natural and Moral Philosophy, and Composition. The senior sophisters compose in English and Latin, and study Metaphysics, together with the elements of Natural and Political Law. There is in this Institution a Professor of Divinity, a Professor of Mathematics and Natural philosophy, and a Professor, who teaches Medical science and Chemistry. The President is also Professor of History. The number of Tutors is small, and variable. Frequently there has been but one. The annual Commencement is held on the fourth Wednesday of August: and is attended by a numerous assembly of gentlemen and ladies, from the surrounding country. The annual revenue of this

\* The number of Alumni to the year 1816, was 1,190, of whom 992 were living. The whole number of Alumni who had been ministers of the Gospel was 263, of whom 228 were then living.—*Purb.*

college, arising from tuition, was in the year 1793 about \$2,000 ; and the rent of its lauds near \$500 more. By contracts made that year, it was to amount, in 1797, to \$1,500, and, in 1805, to \$2,166 $\frac{2}{3}$ .

There are two Vacations in this Institution : one, immediately succeeding the Commencement, and continuing six weeks and two days ; and the other, beginning on the fourth Monday in February, and continuing five weeks and five days.

The first Collegiate building erected here, stood almost twenty years ; and was then consumed by fire. Another has been since erected, (in 1786,) one hundred and fifty feet long, and fifty feet wide ; of three stories. It is built of wood. The figure is the same, as that at Providence, formerly described, and both are copies of that of Princeton. The public rooms, containing the library, philosophical apparatus, and a number of natural and artificial curiosities, are in a projection at the centre. This building has a decent appearance. At a small distance from the College Southward stands a Chapel ; the arched ceiling of which, ascending from the four sides, produces the same effect, as the whispering gallery in the dome of St. Paul's. A whisper, uttered in one of the angles, with so low a sound as not to be audible six feet from the speaker, is very distinctly heard in the opposite angle. These buildings stand on the Eastern side of a square, surrounded by decent houses, and covered with a lively verdure. The Trustees of this College fill up their own vacancies. In the act, granting the 42,000 acres of land, mentioned above, the Governour and Council of the State, for the time being, are incorporated with the Trustees for the purpose of acting with them in the management of all the funds, which have been or shall hereafter be, granted to the College by the State.

The original design of educating Indians, and Missionaries to the Indians, has been frustrated. Two of the natives, only, have been graduated in this Seminary. For three years after it was founded, a small number of Missionaries, and persons destined as candidates for this employment, were sent among the Indians. From that period, it is believed, all efforts of this nature have

ceased. You are not to suppose that any blame is to be attached either to Dr. Wheelock, or any others entrusted with this concern. An Indian student cannot be obtained, ordinarily, without extreme difficulty. What is at least as unfortunate, his habits are in a great measure fixed, before he can be brought to a place of education; and more resemble those of a deer, or a fox, than those of a civilized youth. In the literal sense, he must be tamed; and to tame him is scarcely possible. He may possess the average talents, or even those which are superior. He may learn, (for some of them do learn,) easily, whatever is prescribed to him as a task. Still he is a perfect devotee to idleness and wandering; impatient of subordination; hostile to regularity of life; and enslaved to his gun, and his dog. To ingraft literature and science on such a stock demands a degree of skill, patience and perseverance, not often found in the mind of man. Few employments have been more hopeless than this; even among those, which have been originally considered as desperate; and no instructor of Indians, since the commencement of Philip's war, except the Mayhews and Brainerds, has had much reason to congratulate himself on the success of his efforts.\*

As to Missionaries, you will remember, that Dr. Wheelock began his administration in 1770; and that the American war commenced in April 1775. This event induced the Indians to take up arms against the Americans; and thus interrupted all friendly correspondence between us and them. A termination of hostilities did not take place until the year 1794 when they were finally defeated by General Wayne, and an end put to Indian wars, it is to be hoped, on this side of the Mississippi. It is not, therefore, to be wondered at, that Missions to the natives, should, for a long period, be wholly interrupted. Since this date, the business of Missions has been extensively taken up by other bodies of men; able in many respects to pursue it with more facility, and with more advantage, also, than the Trustees of a literary institution.

\* Since this was written, Missionaries have been stationed at Brainerd and Elliot among the Cherokees, and Choctaws; and their labours, hitherto, promise to be successful.—*Pub.*

Those, who liberally contributed to the establishment of this Seminary, would, were they alive, have the satisfaction of seeing, that although it has not answered the very ends, at which they, perhaps, especially aimed, it has yet been a source of extensive benefit to mankind.

The village of Dartmouth contains, perhaps forty houses; several of which, to our surprise, were ragged and ruinous. In so recent a settlement this was hardly to have been expected. On my return, in October 1803, I attended divine service in the church at this place; and never, unless in a few instances at Wethersfield, many years since, heard sacred music, which exhibited so much taste, and skill, as were displayed here.

Directly West of the College, at the distance of half a mile, a bridge is built over Connecticut river. It consists principally of a single arch; the chord of which is two hundred and thirty feet. It is a copy of the arch in the bridge over the Piscataqua; and, except that, is the longest in New-England. The abutments, on which the arch stands, are of stone, and forty feet square. The whole length of the bridge is three hundred and forty-four feet; and its breadth thirty-six. The property in it was originally divided into two hundred shares of sixty dollars each; amounting to 12,000 dollars. The expense has somewhat exceeded this sum.

Since we were on this ground, this bridge has been carried away. I have been informed, that one of the abutments was undermined by the river, and gave way; in consequence of which the bridge fell entire.

When we arrived at Dartmouth, we found the inhabitants just recovered from a severe dysentery. Of 520 persons, the whole number in the village, 220 had been sick; and 22 had died.

The township of Hanover, of which we saw only the Western skirt, is said to be generally fertile. It was incorporated in 1761; and contained in 1775, 434 inhabitants; in 1790, 1,380; in 1800, 1,912, and in 1810, 2,135.

There are two Congregations in this township besides that in the village of Dartmouth.

I am, Sir, yours, &c.

## LETTER X.

Lyme—Orford—Piermont—Haverhill.

*Dear Sir,*

THURSDAY, September 28th, we left Dartmouth; and proceeded to Haverhill through Lyme, Orford, and Piermont: twenty-eight miles. The road, for a country so newly settled, was good.

Of Lyme, the township immediately above Hanover, we saw very little; as the road passes along the foot of the hills, and very near the river. The journey was, however, pleasant and romantic: the river, bordered in several places by small intervals, being frequently in sight, and forming a cheerful contrast to the solemnity of the forest.

The township of Lyme, which is extensively settled, and well cultivated, is said to be excellent land. A mine has been lately discovered here, which, we were told, yields good steel immediately from the ore, or with very little preparation.

Lyme was incorporated in 1761; and, in 1775, contained 252 inhabitants; in 1790, 816; in 1800, 1,318; and, in 1810, 1,670; all included in one congregation.

Orford lies immediately North of Lyme; and contains a village on the road. It is built on a beautiful plain, bordered by intervals on the West. The hills on both sides of the river, near the centre of the expansion, approach each other, so as to form a kind of neck; and, with a similar approximation at the two ends, give the whole the appearance of a double amphitheatre, or of the numerical figure 8. The greatest breadth of each division is about a mile and a half; and the length of each between two and three miles. On the Western side of the river, and at the Northern end of each division, rises a fine, bold bluff: the Southern, named Coney's, the Northern, Sawyer's, mountain. I was informed, that a gentleman, in the neighbourhood, had measured Coney's mountain, and found the height of it to be four hundred

and fifty feet above the surface of the river. Sawyer's mountain is little, if at all, inferior. Both are very noble objects; being perpendicular cliffs of grey granite, terminating almost immediately on the road. In a part of the country, where precipices are uncommon, the effect, produced by these remarkable promontories on the landscape, is exquisite.

Orford is chiefly built on a single street, extending between two or three miles along the river. The houses stand all along at moderate distances, and near the centre are built more compactly. Generally they do not rise above mediocrity: a few are of a better class.\* The intervals, particularly in the Southern part of the expansion, are rich. Soap-rock, a soft kind of magnesian stone, free stone, and a grey rock, said to make excellent mill-stones, (granite I presume) are all found in Orford.

In this township there are two mountains; one of which is named *Mount Cuba*, from a dog which bore that name, and was killed upon it by a bear. The other was named *Mount Sunday*, from the following fact. Seven men, one of them a Mr. Palmer, went into the Eastern part of the township, and, in the language of the country, *were lost*; that is, they became wholly uncertain of the course, which they were to pursue, in order to regain their habitations. Palmer insisted, that it lay in a direction, really Eastward, although he believed it to point Westward. His companions, judging more correctly, determined to take the opposite course. In their progress, they passed over this mountain. The day, on which they ascended it, was the Sabbath; and the mountain has, from this circumstance, derived a name, which it will probably retain, so long as the posterity of the English colonists inhabit this country. The six men, returning home, and not finding Palmer, went again in search of him. In a place, two miles Eastward of the spot where they had left him, they found him engaged in a contest with a bear; which had attacked him the preceding evening, on his way. As the bear was advancing towards him, he was fortunate enough to procure a club; with

\* In my journey to the Winipiseogee Lake, I found on my return, this village greatly improved, both in the number and in the appearance of its houses.

which he had been able to defend himself, until he made good his retreat to a neighbouring tree. The bear followed him as he ascended the tree; but his club enabled him to keep the animal at bay, until his companions came up, and delivered him from the impending destruction.

I presume you will wonder at my mentioning these trifling incidents. I have mentioned them because they are trifles. The names of mountains, rivers, and other distinguished natural objects, both here and in England, have often seemed to me strange and inexplicable. The little incidents, which I have mentioned, furnish, I suspect, a probable explanation of this enigmatical subject, in a great proportion of cases. Events, sometimes more, and sometimes even less, significant than these, have, I am persuaded, been the origin of a great part of those odd appellations, given to so many of the objects in question. Among the proofs, that this opinion is just, the oddity, and the vulgarity of the appellations, and the speedy oblivion, into which the causes of them have fallen, are, to me, satisfactory. Their oddity proves them to have been derived from incidents, aside from the ordinary course of things: their vulgarity shews them to have been given by persons in humble life; and the fact, that the sources from which they have sprung have been so soon forgotten, evinces their insignificance. I have mentioned, heretofore, the origin of the name *Mount Lamentation*. This was a case of such importance, as to insure the remembrance of it through a considerable period. Those, which I have now mentioned, are of so late a date, as to make it impossible for them to have been already forgotten. From these we may, I think, infer the origin of very many others. As I have never seen the subject explained, and have often known such an explanation wished, I thought you would pardon these remarks.

Orford is a pretty settlement. The inhabitants are said to be sober, industrious, and well behaved. The township was incorporated in 1761; includes one congregation; and, in the year 1775, contained 222 inhabitants; in 1790, 540; in 1800, 988; and, in 1810, 1,265.

Piermont is a rough, and, generally, unpleasant piece of ground. The soil, also, appears to be lean, and unpromising. From Bradford, opposite to it, there are seen, however, some rich and handsome lands; particularly some beautiful intervals, belonging to this township. Piermont was incorporated in 1764. In 1775, the number of inhabitants was 168; in 1790, 426; in 1800, 670; and in 1810, 877: all included in one congregation.

Haverhill lies immediately North of Piermont. This is a well appearing town, built in a manner somewhat scattered, for several miles along the road. The site is a handsome elevation, overlooking the adjacent country many miles North and South, and not less than six or seven from East to West. The prospect is charming. The soil is loam, mixed with gravel, and suited to every species of cultivation; yet, for a reason which I could not divine, the apple-trees appeared less thrifty than in the country below, and than I afterwards found them in the opposite township of Newbury. In many instances they were decaying, as if with age: yet they were probably of less than thirty years standing.

Haverhill is a half-shire town in the County of Grafton; which begins on the river at the Southern boundary of Lebanon, and extends to the Northern line of the State: more than one hundred and fifty miles. The court-house is a decent building; and stands on a pretty square; which, however, some individual has miserably deformed by building on it a merchant's store, and a stable. On this square there are several neat houses, and a little Northward a handsome church. From the street the ground slopes with unusual elegance to the West; and is succeeded by a chain of intervals.

The other half-shire town of this County is Plymouth, about thirty miles Eastward, on the river Pemigewasset; the longest head branch of the Merrimac. Both towns are remote from the centre of the County.

After leaving the principal settlement in Haverhill, the road passes through a low, forested ground; wet, and unfit for settlement. It then ascends a yellow pine plain, on which is built a lean-looking village, called Haverhill Upper Street, and inferiour

to any other, which we had hitherto passed. I was unable to account for the existence of a settlement on this hopeless soil, until I came to the brow of the plain. Here I discovered a succession of rich intervals, extending along the river several miles, and furnishing a most inviting field to industrious agriculture. The inhabitants of the plain were, I presume, allured to this spot by so tempting an object; but they must have been sadly disappointed. From the skirts of this settlement we discovered several houses, whose brilliant appearance plainly shewed, that their owners had preoccupied all these fruitful lands, and left the inhabitants of the plain to derive their subsistence from the parsimonious grounds in their neighbourhood.

Haverhill was incorporated in the year 1763. The number of its inhabitants, in 1775, was 365; in 1790, 552; in 1800, 805; and, in 1810, 1,105, included in one congregation. There is in this township a quarry of free-stone, and a bed of iron ore.

I am, Sir, yours, &c.

## LETTER XI.

Lower Amonoosuc—Bath—Concord—Girdled trees—Log-houses—Letter of Rev. Mr. Patten—Dangerous state of the roads and bridges in the new settlements—Littleton.

*Dear Sir,*

AFTER leaving Haverhill Upper Street, and passing by several neat houses, the road turns to the right, leaves the Connecticut valley, and enters that of the Lower Amonoosuc. On the rising ground, by which these two vallies are separated, we saw the last yellow pines, and, soon after we had left it, the last oaks, in our rout, until we reached the District of Maine. The Lower Amonoosuc rises in the White mountains; and runs a course of fifty miles. Its waters are every where pure; its bed clean, being composed of rocks, stones, or gravel; and its current gentle and rapid by turns, but always sprightly. Its size is that of Farmington river; and its course, taken together, South-Westerly. The valley, in which it flows, was probably once the bed of a lake; of which the South-Western limit was the rising ground at its foot, which I have mentioned as covered with the last yellow pines in our route. This barrier, over which its superfluous waters formerly descended in their way to the Connecticut, it has gradually worn down to its base.

The valley of the Amonoosuc is from one quarter to three quarters of a mile in breadth. Its sides generally appear more like banks than hills; resembling very strongly the brows of elevated pine plains, heretofore mentioned. There is a beautiful fall in this river about six miles and a half West of the notch of the White mountains. The descent is from fifty to sixty feet, cut through a mass of stratified granite; the sides of which appear, as if they had been laid by a mason in a variety of fantastical forms; betraying, however, by their rude and wild aspect, the masterly hand of nature.

About two miles after the road enters this valley, the scenery is alternately gloomy and cheerful : the river being at times bordered by intervals, and at times running through rude and solitary grounds. For a considerable part of this distance it runs at the foot of the hills on the Northern side ; whose cliffs, and woods, overhanging the stream, form with their wild magnificence a fine contrast to the softer scenery by which they are succeeded. From this spot the river, during a progress of fifteen miles, winds with an elegant course through a chain of intervals, parted into rich farms, and, although recently cleared, and deformed in many instances by log-houses, promising at no great distance of time, both by their fertility and their beauty of surface, to become a residence of peace, industry, and prosperity.

In the year 1803, I found these settlements greatly improved. The girdled trees, stumps, and log-houses, had in a great measure vanished. In their places good farmers' houses, and, not unfrequently, those which were handsome, had been erected. A village, neatly built, had been formed three or four miles above Haverhill Upper Street, at a place called the Lower Mills. The number of mills had also been considerably increased : and one of them, as I was informed, yielded the proprietor \$1,000 a year. The quantity of boards, and scantling, lying by the side of it, certainly gave some colour to the story. A traveller does not often find a more delightful ride than this. The road is good ; the soil fertile ; the surface beautiful ; the verdure vivid ; and the river brilliant, pure, and universally sprightly. Over all was diffused an undisturbed serenity ; a pleasant aspect of retirement ; and that sense of solitude, which, without gloom, or melancholy, softens all the emotions of the mind, and awakens the most pleasurable excursions of the imagination.

The township immediately North of Haverhill, is Bath ; which was incorporated in 1769, and, in 1775, contained 144 inhabitants ; in 1790, 493 ; in 1800, 825 ; and, in 1810, 1,316.

Concord, sometimes called New-Concord, lies North-Eastward of Bath. This township was incorporated in 1768, by the name of Gunthwaite. There is another town in this State, of the name

of Concord, lying on the Merrimac : but the inhabitants of Gunthwaite, claiming that they had first applied for the name of Concord, have insisted, and hitherto successfully, on this appellation for their own township. The most beautiful part of Bath, as well as of Concord, lies in this valley. The rest is made up of the hills on its borders. In Concord, as I was informed in 1803, there has been lately discovered an iron mine, said to yield seventy-five per cent, from the ore, and to be inexhaustible.\*

In 1775 Concord contained 47 inhabitants ; in 1790, 313 ; in 1800, 663 ; and in 1810, 1,126.

In this township we began to find the bridges, and causeys, made of round sticks, and logs. These are built in the following manner. Two large logs are laid from one bank to the other : and these are covered by other small logs, laid in contact, transversely. The surface, which they present, is slippery, cylindrical, and of course unpleasant. They are also liable to speedy, and unperceived, decay ; and when they appear still to be sound, sometimes yield suddenly to the foot, and hazard the lives both of the horse and his rider. When these bridges are once broken, they are frequently left a long time without repair. The inhabitants in the most recent settlements, you will remember, are few, thinly scattered, and poor ; and are also engrossed by their domestic difficulties. At the same time they are so used to these and other inconveniences, that they feel them very little. Hence the necessary repairs are often neglected for a long time. It ought, however, to be by no means forgotten, that these settlers, amidst all their embarrassment, labour, and contribute, for the improvement of roads and bridges, more in proportion to their means, than perhaps any other people.

I have mentioned above *girdled trees* ; and *log-houses*. As it will be impossible for you to understand this phraseology without an explanation ; I will give it. When a planter, in this country designs to cultivate a piece of forested ground, his first business, as you will readily conceive, is to get rid of the trees. This is a work of no small labour ; and to fell them is often beyond his

\* This mine is in Franconia, bordering on Concord.

power. To save himself excessive toil, and inconvenience, therefore, he makes a circular incision with his axe through the bark of the tree. This process is called *girdling*. All the trees, which are girdled, die ; and thus leave the ground sufficiently open for the purposes of cultivation. Grass, corn, and flax, will grow well where the forests have undergone this process: and the farmer is more expeditiously, as well as with less expense, furnished with food, both for his family and his cattle. Still the process is attended with many inconveniences. Beside the uncouth, and disgusting, aspect of fields, left with many dry trees standing, and others blown down, and lying in every direction ; whenever the trees fall, they tear up considerable parcels of ground with their roots ; and, so far as these extend, leave the earth totally bare of its soil. As they are very numerous, and grow every where ; these depredations extend over a considerable part of the whole surface ; and very seriously lessen the value of the land. After the trees have begun to fall, they interrupt every process of cultivation ; and render the ground unfit for pasturage. Often also, when they fall, they break down the fences, kill the cattle, and sometimes destroy human life. In consequence of these disadvantages, the practice of girdling has gone much into disuse, and most of the planters fell the trees universally. Still, there is a sufficient number of girdled trees standing, in many places, to give the new settlements a disagreeable appearance.

A *log-house* is built in the same manner, as the weekwams, which have been constructed in later times by the Indians, and which were mentioned in a former letter, as having been derived from their intercourse with the Colonists. The logs, intended for this purpose, are chosen of one size, and hewn on two opposite sides. They are then cut down to half the thickness at each end, on one of the hewn sides. After this, they are laid upon each other at right angles, and fastened together with wooden pins so as to form the external walls of the building. In this manner they are carried up to a sufficient height ; and covered with a roof, usually of shingles. The crevices are then stopped with mortar ; and the interior is finished according to the fancy, and

circumstances, of the proprietor; always, however, in a plain, and usually a coarse and indifferent, manner. On the conveniences, and inconveniences, of these buildings I shall have occasion to make some remarks hereafter. It will be sufficient to observe here, that, although they are often absolutely necessary to the planter, when he first adventures into the forest, yet they are certainly no ornaments to the landscape. By the New-England planters they are intended only to shelter their families, until they can erect better habitations.

We crossed the Amonoosuc at a ford. The water was deep; and the bottom was composed of stones, so large and smooth, as to make the passage difficult and anxious. The river was pronounced to be low: yet the current was sufficiently rapid to prevent our horses from that secure command of their feet, which seemed indispensable to our safety.

A few years before we took this journey, the Rev. William Patten, of Newport, in attempting to ford this river at the same place, was borne down the stream by the current, forced from his horse, and overturned into the water. A recital of the circumstances, and feelings, of a drowning man, given by himself, will probably be a novelty to you, and perhaps to the world; and cannot fail to interest your curiosity. I will, therefore, give you the history of this adventure, as I have received it from the respectable clergyman, who was the subject of the disaster.

HARTFORD, May 14th, 1802.

“ Sir,

The event, of which you requested an account from me, took place in the eighteenth year of my age. In the spring of that year I attempted to pass a river, called the Great or Lower, Amonoosuc; at a fording place, about forty miles Northward of Dartmouth College. The stream is remarkably rapid: and had, the preceding night, been swollen by copious showers of rain, and the dissolution of snow, on the grounds adjacent. A number of persons with whom I was in company, went over in a boat: but some circumstances induced me, and two or three others, to

attempt to ford the river. About midway of the passage, my horse was turned upon his side; apparently by the force of the current. Thrown by surprise, and with disadvantage, into the water, it was some time before I could recover a standing. The water then flowed up to my chin. As soon, almost, as I was upon my feet, the current bore me down, and left me struggling for breath. I rose again, with the hope of walking to the shore; but in vain. The depth of the water being for a moment more favourable to my hopes, I made several other attempts; in the last of which lying on the bottom, with my feet against the rocks, I determined to suffer my head to be buoyed up, till the weight of my body should counteract the force of the current, that in this inclined position I might be enabled to gain the shore. But I was immediately carried from this point, without finding my resistance of the least avail. After this, as I was in deeper water, and my head down the stream, I attempted for the first time to swim. This exercise, to which I was accustomed, was perfectly easy to me. I rested on the surface of the water without any sensible difficulty, greatly refreshed by the air; which I had not freely inspired for fifteen or twenty minutes. I continued to swim without any other object, than to breathe; but had not proceeded far, before my strength suddenly failed; and I sunk without a struggle to the bottom. Of such an entire exhaustion of strength I never before had an idea. I could not have moved a finger, to save the world. Arguing, from the distress of being partially deprived of breath, the agony of the moment, when it should be totally excluded, I anticipated this moment with extreme dread. When I sunk, this impression was fully on my mind, with a certainty, that it could be no longer avoided. After a short time, however, it occurred to me, that it was time to breathe. With this thought, I relaxed that exertion, by which my breathing was suspended; and, feeling water entering my nostrils, immediately resumed it; having before experienced the pain of inhaling the water, which was much more distressing than to be without breath. Soon after this, my intellectual faculties very rapidly, but perceptibly, declined. I felt a pain in the small of

my back ; which, I presume would have been acute, had I been capable of a just sense of it: for I imagined, that a rock, or some other very heavy thing, lay on me. Before this, I was like a person, under the influence of an overpowering opiate, and yet feeling every inducement to keep awake: and soon after all consciousness of my situation, and life, ceased.

At the first exercise of returning reason, I supposed myself in the bed, in which I had slept the night before ; and that the night was dark and gloomy. The circumstances of the scene, through which I had been carried, occurred in a lively manner to my imagination: but I supposed them a dream. To be certain, I resolved to arouse myself, but in attempting it was conscious of insuperable weakness; and then concluded, that, as I should soon awake, I would try no further exertion. As soon as I rested in this hope, I heard a noise, like a person clapping his hands; and said, "you hurt me." With this recovery of my hearing, my eyesight was restored. I perceived, that I was surrounded by those, with whom I had been in company: some of whom were striking my hands; and some were rubbing my stomach. My feelings, at this time, were greatly distressed. There was but a spark of life in a body of disorder and death: but the hope, with which that spark was connected, spread a smile over the ruins; and I was very happy.

My friends informed me, that I was taken from the water, after I had disappeared about a quarter of an hour, and laid on the shore; that in bringing me to the shore a small sound was perceived from my throat; but that my breast had not moved with breathing; and that my eyes continued lifeless, till the moment, when I spoke.

From the time of my falling into the water till my recovery, nearly an hour must have elapsed. As the struggle was long; so the distress was great. I can give no better description of it, than to say, that my sensations corresponded with the appearance of the dead. My meaning is; that the aspect of a deceased person makes a complicated impression on my mind, very similar to what I then felt; and may be regarded as a very natural symbol of

the state of my own feelings. But the prospect, and to me the certainty, of immediately appearing before God, the Judge of all, was inexpressibly more affecting than the pains of dying. What I felt, in both respects, cannot be described, it can be known only by experience. In such a situation, nothing but the power, and the grace of Christ can support the mind: and I determined, when I recovered, to dwell upon his name, if ever I should be called to attend the dying.”

How far the circumstances of other persons, who have gone through the similar process, resemble those, mentioned in this letter, cannot be ascertained. A Mr. Punderson, of Brookhaven on Long-Island, was drowned, and recovered, in much the same manner; and gave me an account of the event. Unfortunately I did not commit the story to paper at so early a period, as would have assured me of an exact accordance with his recital; and can therefore, only say, that as to the physical facts, it differed immaterially from this of Mr. Patten.

After we had crossed the Amonoosuc, we rode several miles along the North bank of this river; and then, turning to the left, began to ascend the mountains of Littleton. Before we left the flat ground, Mr. L's horse, crossing a pole bridge, fell through, and threw his rider. This was the only disagreeable accident, which befel either of us; and even this was productive of no serious consequences.

In this part of our journey the settlements were much more recent than those, which we had hitherto seen. The roads were less wrought; the bridges were less safe; and all the inconveniences of travelling were both multiplied, and enhanced. The kind of bridges, which we now crossed frequently, I have already described. From the following account you may form a tolerable conception of the roads.

Wherever the earth is thickly covered with vegetable mould; (a fact, existing universally, where the forests have not been frequently burnt;) this substance easily imbibing and long retaining, water, is converted, every wet season, into deep mire: and, where the ground is moist and springy, the effect is not a little in-

creased. On the hills of this country rocks and stones abound; particularly on those, which are high. When roads are cut through the forests; the trees, which have grown near the path, shoot their roots into it, and across it, both on the surface, and beneath. In the former case, a horse is in danger of stumbling by striking his feet against the obstruction: in the latter, he is often still more exposed. When he sinks into a spot of deep and stiff mire, he sometimes steps partly on the root, hidden by the earth; and is in danger of falling, either by slipping off, or by being disappointed of his expected position. At other times, he steps immediately by the side of the root: and when he attempts to take the next step, is exposed to falling by striking his hoof against it. The roots, also, are branched, often entangle him in their forks, and sometimes between parallel branches, running near to each other. After they have decayed, they break; and then endanger his falling by the suddenness, with which he goes down into the mire. To all these hazards, except the last, he is still more exposed by the rocks and stones, which in these miry places often lie beneath the surface. Even on the surface they are an extreme inconvenience to the traveller; and present to him not a small degree of danger, in many parts of a recently settled country. In the roads newly opened the stumps are still worse. Horses, unused to them, scarcely observe them at all; because they are almost of the same colour with the surface.

Wherever a forest borders on the road; trees are frequently blown down, and in many instances lie across it for a considerable time. Here the traveller is forced to make his way round them as well as he can. Whenever the wind blows with violence, he is in no small danger of being crushed by their fall: a fate which has sometimes arrested travellers, in roads corresponding with this description.

In addition to all these evils, the causeys, which I have heretofore described, abound, of course, on every miry surface. These, you will recollect, are made of round, smooth poles; and therefore furnish, at the best, a very imperfect footing. Some

of them are soon displaced; and others broken. The inhabitants, in the mean time, are so few, so poor, and so much occupied in subduing their farms, and in providing sustenance for their families, that it is often a long time, before these bridges are repaired. Such, upon the whole, was the state in which we found them, that they soon became objects of more dread, than any other inconvenience attending our journey.

We began to ascend the mountains of Littleton in the dusk of the evening. The moment we entered the forests on its side, it became dark. Here all the dangers, mentioned above, assailed us at once. The mire was often so stiff, and so deep, that our horses scarcely struggled through it. The roots also, the stumps, rocks, stones, and causeys, multiplied upon us in almost every part of our progress: while the darkness was such, as to prevent us from discerning the extent of our danger, and to keep us in a continual state of anxiety and alarm. At times indeed, the moon glimmered doubtfully on our path; but the forest was so thick, throughout most of the way, as effectually to intercept its light. In this manner we laboured on five miles, before we reached our destined inn. At length, we arrived in safety; but found the inn-keeper absent, and ourselves obliged to take the necessary care of our horses. For this there was no help: and we submitted to it with the best grace in our power. Mr. L. went to bed supperless, and sick with the head-ache. I consoled myself with a cup of coffee, and a partridge: an entertainment, which I had hardly expected in a house, just built in an almost impenetrable forest, on a high mountain, and in a spot, where the first stroke of the axe was struck scarcely five years before. At that period, as the inn-keeper afterwards informed me, he set out from Andover in the winter, on an ox sled, with his wife and one child, to seek his fortune: i. e. to find a settlement for himself and his family. Providence led him to this place. He was already beginning to live comfortably. When I visited Littleton in 1803, I found him in possession of a good house; a good farm, well cleared, and cultivated; and in prosperous circumstances.

What motives could induce a man, even as enterprising, and determined, as our host appeared to be, to plant himself in a spot, so desolate and forlorn, with the expectation of living at all, it is not easy to imagine. I found, however, by conversing with him, that those, which appeared to me insuperable difficulties, he laughed at as mere trifles. Happy resolution. Were all men as easily deterred from difficult enterprises, as votaries of pleasure, or even of study; a great part of the earth would now be a desert.

Littleton is almost merely a grazing ground. It was incorporated in 1784; and contained, in 1790, 96 inhabitants; in 1800, 381; and, in 1810, 873. I am, Sir, yours, &c.

## LETTER XII.

Public roads—Dalton—Lancaster ; slow progress of its settlement—Climate of this region—Snow storms and prevailing winds singularly affected by the proximity of the White Mountains—Extensive and beautiful landscape.

*Dear Sir,*

ON Saturday, September 30th, having slept soundly, and awakened in good spirits, we left Williams' ; and rode through Dalton to Lancaster, fourteen miles, to breakfast. The road, for the first eight miles, is on the same mountainous ground, and embarrassed with the same disagreeable circumstances. One part of it, extending three quarters of a mile, is so absolutely covered with stones, as to have given rise to a proverbial remark, that in this spot no horse ever set his foot on the ground.

The height, and rudeness, of these mountains must prove a serious obstruction to all travelling for pleasure, from the country below to the country above, unless an easier passage should be found. Roads in a new country are originally laid out to accommodate the first settlers ; and are, in a great measure, mere passages from farm to farm. When a township has become generally settled ; they are usually so far changed, as to suit the convenience of the inhabitants, considered as a body. The next change is generally made, to promote an easy correspondence with the neighbouring townships. Finally, the country at large, with a late but controlling efficacy, directs the course of all the principal roads, so as to suit the general interests of the community. These interests, however, become operative chiefly, if not solely, after considerable advancements are made in wealth and population. Then the most direct courses, and the most feasible grounds, are chosen for general communication. Massachusetts and Connecticut have for some time been diligently employed in forming all the principal roads, throughout their respective jurisdictions in this manner.

It will probably be a long time, before the country, through which this part of our journey lay, will be sufficiently wealthy,

and populous, to reach this last stage of improvement. The difficulty, which prevents a passage along the Connecticut, is created by the abutment of these mountains, and others opposite to them, on the river. This would undoubtedly make the construction of a road, on their steep declivities, expensive, if not impracticable. The travelling is insufficient to justify, and the inhabitants are unable to sustain, any considerable expense. Better ground than that of the present road has, it is said, been found farther Eastward: and there is a distant reason for hoping, that it may hereafter be occupied.

Dalton lies partly on the Northern declivity of these mountains, and partly on a long and narrow flat. The former is good grazing ground: the latter, consisting of both a plain and an interval, is suited to every kind of cultivation.

The township is chiefly the property of some gentlemen, residing in Providence, and New-York, who are able, and it is said, disposed, to retain their possessions. Hence the population has made a slow progress. Doctor Belknap says, that in 1755, the number of the inhabitants was 50. I suspect this to be a typographical error: for by the census of 1790 they were but 14; and by that of 1800, 62. In 1810, their number was 235.

Lancaster and Northumberland in New-Hampshire, and the towns opposite to them in Vermont, compose a tract, long known in New-England by the name of *the Upper Coos*. Of the meaning of this word I am ignorant. From its application to places, where there are remarkable intervals, and where there are no other distinguishing objects, except a peculiar winding of rivers, it seems probable, that one or other of these must be denoted by the term. Lancaster has, accordingly, been especially designated by this title; probably because it contains large tracts of such land. This was undoubtedly the reason, why it early engrossed the attention of purchasers, notwithstanding its Northern situation, and its remoteness from every New-England settlement. It was incorporated in 1763.

In the year 1766, a Mr. Page planted himself here on the richest and most beautiful of these lands; a large share of which he

left to his descendants. It cannot be denied, that he merited his valuable possessions by uncommon enterprise, industry, and perseverance. A single fact will strongly illustrate this observation. For several years, after he came to this spot, he carried all his bread corn to Charlestown, (one hundred and twenty-four miles,) to be ground. For a considerable time he lived with his family in absolute solitude. There was not a single road in the neighbouring region. All his communication with the world was either through the wilderness, or down the channel of the Connecticut, and this he was obliged to enter below *the fifteen mile falls*, and at the distance of twenty miles from his house. When any member of his family was sick; he had neither physician, nor nurse, except what the house itself contained.

The settlement of this township, thus begun, was seriously obstructed by two causes: the American war, and the high value, set by the proprietors upon their lands. All these sold their property with reluctance; and one of them, who owned more than half the township refused to sell at all. Hence there were, in 1787, only five families in Lancaster; beside two or three French families, who resided here transiently. Doctor Belknap, indeed, makes the number of inhabitants, in 1775, 60. If this number be correctly stated, it must have partly consisted of individuals, who came hither to begin the cultivation of farms, and being discouraged by the war, gave over the design. In 1790 the inhabitants amounted to 161. In 1794, the number of families was 40. In 1800 there were 440 inhabitants. In 1803, the number of families was estimated, to me, at 90; and in 1810 the number of inhabitants was 717.

The principal settlement is formed on a street, lying upon a handsome plain, on the North side of Israel's river, and appropriately called *the street*. It is about half a mile in length, wide, straight, and handsome; and contains nearly one third of the houses in the township. The other settlements are partly on the road along the Connecticut, both above and below the street, and partly on the road to Portland. The houses are in some instances neat and good; in others decent; and in a few are built of logs.

In the year 1794, the people of Lancaster, raised, and covered, a church of a sufficient size to contain the largest congregation, which will be included within their boundaries for many years to come. At the same time they settled the Rev. Joseph Willard as their minister. The reasons, which determined them to make these expensive efforts at this early period, were their entire union with respect to both objects, and the danger of being less harmonious at a future time. I am disposed to give them no small credit for the wisdom of this determination; the liberality with which they carried it into effect; the harmony with which they settled Mr. Willard; and the affection, which they exhibit both to him, and to each other.

The lands in Lancaster are naturally divided into three classes: the intervals; the plains; and the hills. They are all generally rich. A part of the plains, is, however, sandy and light. The intervals amount to more than sixteen hundred acres.

Israel's river, an excellent mill stream, which runs through the middle of this township, has its source in the White Mountains; is about thirty miles in length; and furnishes a great number of the best mill seats. So many mills are already erected on it as to give a busy, cheerful appearance to the centre of the town.

The climate of Lancaster, and the neighbouring country, is peculiar, and I think delightful. But one Easterly storm had been known here, before the year 1803. This was in February 1802. It began on Saturday, the 19th, and continued a week; covering the whole of New-England, and a large tract of the States Westward and Southward, with the greatest mass of snow, which ever fell at one time within my knowledge. It was four feet deep; and of at least twice the common density. The wind blew with excessive violence; and threw the snow on open ground into waves, and drifts. The mail stage was four days in coming from New-York to New-Haven: a distance of seventy-six miles: although the passengers carried shovels with them, to make a path in the most difficult places. Some of them were badly frozen: and the whole country, for several weeks, might be said to have its intercourse suspended. This storm appears to have been no less severe at Lancaster, than elsewhere.

Rains and snows, in this region, almost universally come from the Western side of the heavens, and chiefly from the North-West. Snow falls here in a singular manner. A light fleecy shower descends, frequently, for a few minutes in the morning; when the sky becomes perfectly clear, and the day perfectly fine. In this manner it has been known to fall thirty successive days, and yet to cover the ground scarcely to the depth of six inches. By this gradual accumulation it has sometimes arisen in the forests, to the height of thirty inches: commonly it has not exceeded eighteen. Travelling in the winter, therefore, is here easy and pleasant, and the weather generally delightful.

The snow rarely lies permanently at Lancaster, until after the tenth or fifteenth of December; and generally leaves it about the middle of March.\* At this time the earth is usually free from frost. A stick, forced through the snow in the month of February, enters the earth without difficulty: the snow falling so early as to prevent the frost from penetrating the earth to any depth, and dissolving the little, which had previously existed. Hence the pastures suddenly become green, and cattle are safely turned into them in the middle of April. The time of pasturage is, therefore, as long here, as in Connecticut. In this manner that tedious period, styled the breaking up of the frost, is here chiefly prevented: and the warm season is annually lengthened, so far as the purposes of gardening and agriculture are concerned, about a month every year.

This advantage is by no means confined to Lancaster, or its neighbourhood. The bounty of Providence has spread it over extensive tracts in the Northern parts of New-England, and over most of those high and cold elevations, which in countries even farther South, would otherwise furnish too short a summer for safe and successful husbandry.

The peculiar state of the weather at Lancaster, so different from that in other parts of New-England, I attribute to the proximity of the White Mountains. These are so high, that they stop the progress of the Easterly winds; or more probably elevate their course

\*The winters in New-England had been mild for several years.

into a region of the atmosphere far above the surface; and prevent them from striking the earth, until they arrive at the Green Mountains on the West. The Westerly winds in the mean time impinging against the White Mountains, twenty-five miles beyond Lancaster, but in regions of the atmosphere considerably elevated, are checked in their career, just as a wind is stopped, when blowing directly against a building. A person, approaching near the building, perceives a calm, notwithstanding he is in the course of the blast. In the same manner, these mountains, extending thirty miles from North to South, and rising more than a mile above the common surface, must, it would seem, so effectually check the current of the North-West wind, as to render its progress moderate, and agreeable, for many miles, towards that quarter of the heavens. Whether the cause here assigned, be the real one, or not, the fact is certain; and gives this region in the pleasantness of its weather a superiority over many others.

The salubrity of the climate in Lancaster may be estimated from these facts. In 1795, there were in this township forty families; and in 1797, sixty. Within these three years, only one adult, and three children died: a little more than one in three hundred annually.\*

The scenery of this region is remarkably interesting. To give you just conceptions of its appearance, it will be necessary to present you with a summary geographical description of the country.

From the Northern limit of Lancaster to the Northern limit of Bath, a distance of thirty miles in a direct line, and of thirty-five on its own course, the Connecticut runs from the North-East to the South-West. Above Lancaster its direction, exclusive of its windings, is not far from North to South: this town lying on the exterior of the angle. About twenty miles on the Southern part of the former direction the mountains abut upon the river. Eight miles below, the valley begins to open, by the recession of the hills in Dalton; and, expanding rapidly, becomes about six miles

\*In the year 1803, this town was visited by the scarlet fever, which carried off several children.

wide at *the street* ; and continues of the same breadth about fifteen miles farther. From Lancaster a vast bason, somewhat more than twenty miles in length, and twelve in breadth, opens to the South-East ; bounded on the North by the little Moosehillock, on the South-West by the mountains of Littleton, and on the South-East by the White Mountains. Immediately North of the little Moosehillock opens the valley of the upper Amonoosuc, seven or eight miles in breadth, and more than twenty in length ; spreading Eastward to the range of the White Mountains. A considerable part of this valley is visible at Lancaster ; and, together with the other two parts of this vast expansion, constitutes a field of view, singular in its form, unrivalled in the nobleness of its boundaries, and furnishing all the beauty and magnificence, of which a landscape is capable.

In my first journey, I pronounced this the pleasantest country, which I had seen, North of Deerfield. The settlements were then few ; the cultivated farms scattered, and small ; and the houses generally indifferent, or very poor. Few persons, even among those, who are accustomed to examine prospects with a critical and impartial eye, are able so far to divest themselves of the disagreeable impressions, made by these objects, as to determine on the real appearance of a country, in a manner, which will afterwards be deemed just and satisfactory even by themselves.

In the year 1803, I found the scenery in this region more interesting than I had before imagined. The country was more cleared, and cultivated ; the population considerably increased ; the buildings were better, and more numerous ; the outline was more distinctly comprehended, and more pleasingly filled up. In the first view of a new region, the mind, from its absolute want of knowledge concerning every thing within its grasp, finds not a little difficulty in settling upon certain capital points, as stations, from which it may proceed in all its enquiries ; and to which every thing of inferior importance must be reduced, in order to fix the proportions, and relations, of the subordinate parts, and thus correctly adjust the situation of the whole. In this case, the im-

agination is equally at a loss with the intellect; and until it has fixed its own stations, drawn its outline, and referred its inferior images to this scheme, will find all its succeeding efforts to form the perfect picture, for which it labours, vain. The writer will in this case perceive a certain indistinctness spread over his descriptions, unsatisfactory to himself: and the reader will derive from them impressions, which are imperfect, feeble, and perplexing.

The Connecticut valley is a prominent part of this landscape. In its extent it is magnificent: in its form it is beautiful. The River, here thirty rods in breadth, and so deep, as every where to be ferried over, winds round a succession of the richest, and most gracefully formed intervals, in a manner unexampled. There are three peninsulas at Lancaster, of the same beautiful form with the Oxbow at Newbury; and several others in Lunenburg, and Guildhall. Handsomer, and richer lands, probably do not exist. The hills, which limit this valley on the West, by their happily varied forms, and moderate heights, furnish one interesting variety in the picture. The valley of the Amonoosuc is scooped with uncommon beauty: the surface bending with a graceful, inverted arch from the river to the summit of the mountains, by which it is bounded on the North. This range, called the Peaks, presents to the eye, at Lancaster, two conical summits: the handsomest, and most regular, which I have ever met with. The little Moosehillock, which separates this valley from the great basin, is a magnificent ridge. Its whole length is in full view for twenty miles. Its summits are finely figured, and richly diversified. The basin is a vast ellipsis, comprising the townships of Duraud and Jefferson, and several other extensive tracts; and is watered through its whole length by Israel's river. The mountains of Littleton protrude their bold and lofty promontories into its South-Western border: and the White Mountains bound it upon the South-East with a grandeur indescribable.

The present, imperfect state of the settlements in this region will, I am well aware, prevent many persons from forming just views concerning the splendour of its scenery. In so vast an ex-

pansion the eye perceives a prevalence of forest, which it regrets ; and instinctively demands a wider extent of smiling scenes, and a more general establishment of the cheerful haunts of man. This temporary defect, from a long acquaintance with objects of this nature, and a perfect knowledge, from experience, of the rapid progress of cultivation, I easily overlook ; and am, of course, transported in imagination to that period, in which, at a little distance, the hills, and plains, and vallies, around me will be stripped of the forests, which now majestically, and even gloomily, overshadow them ; and be measured out into farms, enlivened with all the beauties of cultivation. In the place of the log hut, and the cottage raised but one degree above it, will ascend neat, and even elegant mansions. Girdled trees, whether standing or fallen, stumps, rough and imperfect enclosures of logs, I consider merely as steps in the progress of improvement. Rocks and stones, now scattered over the half subdued farm, will soon be changed into neat, strong, and durable walls. The slough will be covered with a causey ; and the marsh, by draining, be converted into a meadow. In a word, whatever is rude, broken, and unsightly, on the surface, will, within a moderate period, be levelled, smoothed, and beautified, by the hand of man. Where nature, stripped of her fringe and her foliage, is now naked and deformed, she will suddenly exchange the dishabille ; and be ornamented by culture with her richest attire. The meadow will glow with verdure, and sparkle with the enamel of flowers. Flocks and herds will frolic over the pasture ; and fields will wave with harvests of gold. To do justice, therefore, to this and every other landscape in the same stage of settlement ; I mean that, which will permanently be justice ; all these imperfections must be left out of the account ; and the country exhibited, either as it is in a state of nature, or as it will soon be in a state of complete cultivation.

With these views of the subject, I hesitate not to pronounce the region, before me, to be, in many respects, the most interesting landscape, which I have ever seen.

I am, Sir, yours, &c.

## LETTER XIII.

Character and Enterprise of Rosebrook.

*Dear Sir,*

WE left Lancaster October 2d, 1797, at eleven o'clock, with very favourable impressions both of the town, and the inhabitants. In the family of the Rev. Mr. W. with whom we had lodged, we had spent our time in a very agreeable manner; and had received from them every office of kindness and hospitality. Our road lay through a wilderness, in which, as I have heretofore observed, there were but four houses in forty miles. It was also, throughout a considerable part of the distance, incumbered with all those disagreeable circumstances, which I have mentioned in the account of Littleton; but was travelled with the consciousness of absolute safety from every unwelcome intrusion of man. With the noblest scenery around us, and with the best health and spirits, we pursued our course.

We dined at Jefferson, at this time called Dartmouth, and containing only a single house on the road, built many years since by Colonel Whipple, the proprietor of the township. The house was occupied by two old people; a man, and his wife; named Haight. While we were dining here, on fare so bad, that with difficulty we swallowed a little part of it, our meal was embittered by the sight of our innkeeper, walking around the room in a singular kind of fit; perfectly possessed of his senses, but unable to speak, and exhibiting a countenance constricted and ghastly.

After dinner we rode to Rosebrook's, where we arrived about sunset. The whole distance was twenty miles.

This man, with a spirit of enterprise, industry, and perseverance, which has surmounted obstacles, demanding more patience and firmness, than are in many instances required for the acquisition of empire, planted himself in this spot, in the year 1788. At that time there was but a single house within twenty miles: viz. that where we dined. There are now two others: one within

seven, the other within thirteen miles, in the valley of the White Mountains ; and the inhabitants of these are his nearest neighbours. Here he stationed himself in an absolute wilderness ; and was necessitated to look for every thing, which was either to comfort or support life, to those, who lived at least twenty miles from him, and to whom he must make his way without a road. By his industry he has subdued a farm of one hundred and fifty, or two hundred acres ; and built two large barns, the very boards of which he must have transported from a great distance with such expense and difficulty, as the inhabitants of older settlements would think intolerable. He has, however, had the satisfaction, for some time, to see these barns annually filled with the produce of his farm.

He is now preparing to erect a saw-mill ; and after that a grist-mill ; and, when these are finished, he proposes to build himself a house. Hitherto he has lived in a log-hut ; in which he has entertained most of the persons, travelling in this road during the last eight years. The number of these is very great ; and but for this single man it is not easy to conceive how the road could have well been travelled at all. The distance between the houses previously built, is so great, and the region so inhospitable, that travellers would always have been exposed to suffer, and in the cold season to perish, and their horses to starve ; were it not, that they here found the necessary shelter, and supplies. What these hardships and exposures mean you cannot conceive ; and will naturally smile at the assertion, that a log-house can be of so much consequence. We, who passed through this country in the most favourable season, were ready, from our own experience, to admit these facts without a question. For the usual inconveniences of a log-house we were prepared ; but we found comfortable beds, good food, and excellent fare for our horses ; all furnished with as much good will, as if we had been near friends of the family. Our entertainment would by most Englishmen, and not a small number of Americans, be regarded with disdain. To us it was not barely comfortable : it was, in the main, pleasant.

To your mind, which still cherishes the genuine feelings of nature, a rehearsal of "The short and simple annals of the poor," cannot be disagreeable. During twelve, out of fourteen years, this honest, industrious man laboured on his farm without any legal title. The proprietor was an inhabitant of New-York; and sold him the land through the medium of an agent. When he bought it, the agent promised to procure a deed for him speedily. Throughout this period he alternately solicited, and was promised, the conveyance, which had been originally engaged. Nor did he resolve, until he had by building and cultivation increased the value of his farm twenty fold, to go in person to New-York, and demand a deed of the proprietor himself. The truth is; he possesses that downright, unsuspecting integrity, which, even in men of superiour understanding often exposes them to imposition, from a confidence honourable to themselves, but, at times, unhappily misplaced. Here, however, the fact was otherwise: for the proprietor readily executed the conveyance, according to the terms of the original bargain. In my journey of 1803, I found Rosebrook in possession of a large, well-built farmer's house, mills, and various other conveniences; and could not help feeling a very sensible pleasure at finding his industry, patience, and integrity, thus rewarded.

The land, on which Rosebrook lives, is part of a tract in New-Hampshire, granted to two men; one named Nash, the other Sawyer; for discovering the Notch of the White Mountains. This pass, the only one, by which the inhabitants of a large extent of country, North-Westward of these mountains, can without a great circuit, make their way to the Eastern shore, was known to the savages; who used to conduct their prisoners, taken on the coast, through this gap into Canada. By the people of New-Hampshire it was either unknown, or had been forgotten. Nash discovered it; but Sawyer persuaded Nash to admit him to an equal share of the benefits, resulting from the discovery. It was, however, of little advantage to either. They were both hunters; and, with the usual thoughtlessness of men devoted to that employment, squandered the property soon after it was granted.

I am, Sir, yours, &c.

## LETTER XIV.

**Notch of the White Mountains—Head waters of the Amonoosuc and the Saco—Appearance of an American Forest when affected by Frost—Magnificent appearance of the White Mountains.**

*Dear Sir,*

ON the morning of Tuesday, October 3d, we pursued our journey. For some time before we set out, the wind blew with great strength from the North-West; in this region the ordinary harbinger of rain. The clouds, rapidly descending, embosomed the mountains almost to their base. The sky suddenly became dark; the clouds were tossed in wild and fantastical forms; and poured down the deep channels between the mountains with a torrent-like violence: and the whole heavens were overspread with a more gloomy and forbidding aspect than I had ever before seen. The scenery in the Notch of the White Mountains, commencing at the distance of five miles from Rosebrook's, was one of the principal objects, which had allured us into this region. A gentleman from Lancaster, perfectly acquainted with this part of the country, had joined us at Rosebrook's; and proposed to be our companion, and guide, through this day's journey, and to give us all the necessary information concerning the objects, of which we were in quest. If we stayed at Rosebrook's, we should lose his company, and information. If we proceeded on our journey, as the weather was, we should lose our prospects: many of the objects being at such a season invisible, and others, seen with the greatest disadvantage. Happily for us, our storm vanished as suddenly, as it came on. The wind ceased almost in a moment. The clouds began to rise, and separate: and we commenced our journey in the best spirits.

From Rosebrook's, our road lay for about two miles along the Amonoosuc, on an interval. We then began to ascend an easy slope, which is the base of these mountains. After proceeding along the slope two miles farther, we crossed a small brook; one

of the head waters of the Amonoosuc ; and within the distance of a furlong, we crossed another, which is the head water of the Saco. The latter stream, turning to the East, speedily enters a pond, about thirty rods in diameter, lying at a small distance on the Northern side of the road ; and, thence crossing the road again, and winding along the margin of a meadow, formed by a beaver dam, enters the Notch. The North-Eastern cluster of mountains begins to ascend from the pond. The diameter of the meadow is about a furlong. The beaver dam was erected just below the Notch, in a place, happily selected for this purpose. The mountains were scarcely visible at all until we came upon them.

The weather had now become perfectly fine. The clouds, assuming a fleecy aspect, rose to a great height, and floated in a thin dispersion. The wind was a mere zephyr ; and the sky exhibited the clear and beautiful blue of autumn.

The Notch of the White Mountains is a phrase, appropriated to a very narrow defile, extending two miles in length between two huge cliffs, apparently rent asunder by some vast convulsion of nature. This convulsion was, in my own view, unquestionably that of the deluge. There are here, and throughout New-England, no eminent proofs of volcanic violence ; nor any strong exhibitions of the power of earthquakes. Nor has history recorded any earthquake, or volcano, in other countries, of sufficient efficacy to produce the phenomena of this place. The objects rent asunder are too great : the ruin is too vast, and too complete, to have been accomplished by these agents. The change appears to have been effectuated, when the surface of the earth extensively subsided ; when countries, and continents, assumed a new face ; and a general commotion of the elements produced the disruption of some mountains, and merged others beneath the common level of desolation. Nothing, less than this, will account for the sundering of a long range of great rocks ; or rather, of vast mountains ; or for the existing evidences of the immense force, by which the rupture was effected.

The entrance of the chasm is formed by two rocks, standing perpendicularly at the distance of twenty-two feet from each other: one about twenty feet in height, the other about twelve. Half of the space is occupied by the brook, mentioned as the head stream of the Saco; the other half by the road. The stream is lost, and invisible, beneath a mass of fragments, partly blown out of the road, and partly thrown down by some great convulsion.

When we entered the Notch we were struck with the wild and solemn appearance of every thing before us. The scale, on which all the objects in view were formed, was the scale of grandeur only. The rocks, rude and ragged in a manner rarely paralleled, were fashioned, and piled on each other, by a hand, operating only in the boldest and most irregular manner. As we advanced, these appearances increased rapidly. Huge masses of granite, of every abrupt form, and hoary with a moss which seemed the product of ages, recalling to the mind the "Saxum vetustum" of Virgil, speedily rose to a mountainous height. Before us, the view widened fast to the South-East. Behind us, it closed almost instantaneously; and presented nothing to the eye, but an impassible barrier of mountains.

About half a mile from the entrance of the chasm, we saw in full view the most beautiful cascade, perhaps, in the world. It issued from a mountain on the right, about eight hundred feet above the subjacent valley, and at the distance of about two miles from us. The stream ran over a series of rocks, almost perpendicular, with a course so little broken, as to preserve the appearance of an uniform current, and yet so far disturbed, as to be perfectly white. The sun shone with the clearest splendour from a station in the heavens, the most advantageous to our prospect; and the cascade glittered down the vast steep, like a stream of burnished silver.

At the distance of three quarters of a mile from the entrance, we passed a brook, known in this region by the name of the *Flume*; from the strong resemblance to that object, exhibited by the channel, which it has worn for a considerable length in a bed

of rocks : the sides being perpendicular to the bottom. This elegant piece of water we determined to examine further ; and, alighting from our horses, walked up the acclivity, perhaps a furlong. The stream fell from a height of 240 or 250 feet over three precipices : the second receding a small distance from the front of the first, and the third from that of the second. Down the first and second, it fell in a single current ; and down the third in three, which united their streams at the bottom in a fine basin, formed by the hand of nature in the rocks, immediately beneath us. It is impossible for a brook of this size to be modelled into more diversified, or more delightful, forms ; or for a cascade to descend over precipices, more happily fitted to finish its beauty. The cliffs, together with a level at their foot, furnished a considerable opening, surrounded by the forest. The sunbeams, penetrating through the trees, painted here a great variety of fine images of light, and edged an equally numerous, and diversified, collection of shadows ; both dancing on the waters, and alternately silvering and obscuring their course. Purer water was never seen. Exclusively of its murmurs, the world around us was solemn and silent. Every thing assumed the character of enchantment ; and, had I been educated in the Grecian mythology, I should scarcely have been surprised to find an assemblage of Dryads, Naiads, and Oreades, sporting on the little plain below our feet. The purity of this water was discernible, not only by its limpid appearance, and its taste, but from several other circumstances. Its course is wholly over hard granite : and the rocks and the stones in its bed, and at its side, instead of being covered with adventitious substances, were washed perfectly clean ; and by their neat appearance added not a little to the beauty of the scenery.

Young Mr. Rosebrook informed us, on our return to his father's house, that he had followed this stream up the mountain a mile and a half, without any appearance of approaching near to its source. At the road, although the season was dry, it was of sufficient size to turn an overshot mill.

From this spot the mountains speedily began to open with increased majesty ; and in several instances rose to a perpendicular height, little less than a mile. The bosom of both ranges was overspread, in all the inferiour regions, by a mixture of evergreens with trees, whose leaves are deciduous. The annual foliage had been already changed by the frost. Of the effects of this change it is, perhaps, impossible for an inhabitant of Great Britain, as I have been assured by several foreigners, to form an adequate conception, without visiting an American forest. When I was a youth, I remarked, that Thompson had entirely omitted, in his Seasons, this fine part of autumnal imagery. Upon enquiring of an English gentleman, the probable cause of the omission, he informed me, that no such scenery existed in Great Britain. In this country it is often among the most splendid beauties of nature. All the leaves of trees, which are not evergreens, are by the first severe frost changed from their verdure towards the perfection of that colour, which they are capable of ultimately assuming, through yellow, orange, and red, to a pretty deep brown. As the frost affects different trees, and the different leaves of the same tree, in very different degrees ; a vast multitude of tinctures are commonly found on those of a single tree, and always on those of a grove, or forest. These colours, also, in all their varieties are generally full ; and in many instances are among the most exquisite, which are found in the regions of nature. Different sorts of trees are susceptible of different degrees of this beauty. Among them the maple is preeminently distinguished by the prodigious varieties, the finished beauty, and the intense lustre, of its hues ; varying through all the dyes, between a rich green and the most perfect crimson ; or more definitely, the red of the prismatic image.

There is however, a sensible difference in the beauty of this appearance of nature, in different parts of the country, even where the forest trees are the same. I have seen no tract, where its splendour was so highly finished, as in the region, which surrounds Lancaster for a distance of thirty miles. The colours are more varied, and more intense : and the numerous evergreens furnish, in their deep hues, the best ground work of the picture.

I have remarked that the annual foliage on these mountains had been already changed by the frost. Of course, the darkness of the evergreens was finely illumined by the brilliant yellow of the birch, the beech, and the cherry, and the more brilliant orange, and crimson of the maple. The effect of this universal diffusion of gay and splendid light was to render the preponderating deep green more solemn. The mind encircled by this scenery, irresistibly remembered, that the light was the light of decay; autumnal and melancholy. The dark was the gloom of evening, approximating to night. Over the whole, the azure of the sky cast a deep, misty blue; blending, toward the summits, every other hue; and predominating over all.

As the eye ascended these steeps, the light decayed, and gradually ceased. On the inferior summits, rose crowns of conical firs, and spruces. On the superior eminences, the trees, growing less and less, yielded to the chilling atmosphere; and marked the limit of forest vegetation. Above, the surface was covered with a mass of shrubs; terminating, at a still higher elevation, in a shroud of dark coloured moss.

As we passed onward through this singular valley, occasional torrents, formed by the rains, and dissolving snows, at the close of winter, had left behind them, in many places, perpetual monuments of their progress in perpendicular, narrow, and irregular paths, of immense length; where they had washed the precipices naked, and white, from the summit of the mountain to the base.

Wide and deep Chasms, also, at times met the eye, both on the summits and the sides: and strongly impressed the imagination with the thought, that a hand, of immeasurable power, had rent asunder the solid rocks, and tumbled them into the subjacent valley. Over all, hoary cliffs, rising with proud supremacy, frowned awfully on the world below, and finished the landscape.

By our side the Saco was alternately visible and lost; and increased, almost at every step, by the junction of tributary streams. Its course was a perpetual cascade; and with its sprightly murmurs furnished the only contrast to the majestic scenery around us.

Two miles from the entrance, we came to a farm, belonging to a man of the name of Davies; on the first spot, where the mountains recede sufficiently to allow of a settlement. Here the Notch of the White Mountains terminates. The first quarter of a mile is a mere chasm between ruptured cliffs. The remainder is a vast ravine. Throughout the whole of this distance the road descends rapidly; (as it does indeed, but with less rapidity) to Conway; twenty-five miles. When we entered upon this farm in 1803, a fire, which not long before had been kindled in its skirts, had spread over an extensive region of the mountains on the North-East; and consumed all the vegetation, and most of the soil, which was chiefly vegetable mould, in its progress. The whole tract, from the base to the summit, was alternately white, and dappled; while the melancholy remains of half burnt trees, which hung here and there on the sides of the immense steeps, finished the picture of barrenness and death.

At the South-Eastern extremity of this farm, we had a new, and very interesting, retrospect of these mountains. Widest asunder where we stood, they gradually drew nearer, until they closed in the North-West; exhibiting in the most lively manner the appearance of an avenue, formed by mountains of vast height, and extending more than two miles in length. At the head of this avenue rose a pointed summit, white with naked rocks, and over-looking every other.

The Saco was already swollen to a mill stream; and both itself, and its tributary cascades, enlivened our journey with their murmurs.

When we had rode six miles farther, we came to another farm, occupied by a man whose name was Crawford. Here the mountains assumed the form of an immense amphitheatre; elliptical in its figure; from twelve to fifteen miles in length; from two to four in breadth; and crowned with summits of vast height, and amazing grandeur. Compared with this scene, all human works of this nature; that of Titus particularly, so splendidly described by Gibbon, are diminished into toys and gewgaws. Here more millions could sit, than hundreds there; every one of whom might look down with a full view on the valley beneath.

The South-Eastern extremity of this farm was in the year 1782, the scene of a very melancholy event. A young woman, who had been employed at Jefferson in the service of Colonel Whipple, had fallen deeply in love with a young man, in the service of the same gentleman. At the close of autumn they agreed to go together to Portsmouth. On some occasion or other, she was induced, before the time fixed for their departure, to go over to Lancaster. When she returned, she found him unexpectedly gone; and determined to follow him. December was already far advanced; and the snow had fallen to some depth. There was not a house between Colonel Whipple's and Bartlett; a distance of thirty miles; and only a horse road. The family laboured to dissuade her from the journey: but she persisted in her design, and set out on foot and alone. She reached this place with extreme difficulty; twenty-three miles from the house which she had left; and here, as it would seem, finding her strength fail, wrapped herself in her long cloak; lay down under a bush, whose branches, covered with a heavy weight of snow, were expanded like the leaf of a table; fell asleep; and died. She was found, stiffened with frost, about a month afterward by some persons, who went out to search for her; and was buried.

From this place the mountains continually receded, and diminished their height, until we came to Bartlett; the first settlement in the valley, and the first spot, where it is wide enough to admit of a settlement.

I am, Sir, yours, &c.

## LETTER XV.

Bartlett—Politician—Conway.

*Dear Sir,*

BARTLETT derived its name from his Excellency Josiah Bartlett, some years since President of this State. The township contains 12,000 acres, lying on both sides of the Saco; and is the extreme limit of the county of Grafton in this quarter. The lands capable of cultivation are a long narrow strip: those on the South-Western side indifferent: those on the North-Eastern are said to be better. The settlement is composed of farms, and ordinary buildings, exhibiting no near prospect of considerable improvement.

In the year 1790, the township contained 248 inhabitants; in 1800, 548; and in 1810, 436. Our innkeeper had a good house; and appeared to be thriving.

While we were at this house, we were privileged with the company of a man, from whose character, if they could realize and apply it, the plain inhabitants of every country, under a republican government, might derive some useful instruction. We were scarcely seated, when he thrust himself into the room; and without any preface began a conversation on politics, which he addressed principally to me. At this time, the depredations of France on our commerce had become extensive, and outrageous. The Government had very lately adopted a series of measures, which strongly indicated an approaching war. Our companion made several enquiries relative to this subject, as if he wished for information. I answered, that both Congress and the Country would probably resist these aggressions with firmness, and effect. He then told me, he hoped, and presumed, that the Government would adopt measures of a very different nature; that France was the greatest power upon earth; that the French nation was the most respectable of all nations; that all others must finally submit to their dominion; and that America might as well yield

first, as last ; since she must undoubtedly yield in the end. When I ventured to question the soundness of these assertions, he roundly replied that they were certain truths ; that the French fought better, managed their political affairs better, and wrote better, than the inhabitants of any other country. Ill as I had succeeded before, I summoned sufficient resolution to question even these assertions, oracularly as they were delivered ; and to deny, particularly, this superiority of French writers. My antagonist, however, settled the point, in a moment, by declaring decisively, that the French writers, and particularly General Dumourier, left all others behind them. Recollecting himself however, he subjoined, that he thought one exception ought to be made. Mr. *Thomas Paine*, he must acknowledge, on all the subjects, discussed by him, wrote with skill and talents unrivalled by any other man. Mr. Paine, however, had never written on subjects of a military nature : and it was therefore impossible to determine whether he could handle these subjects better than Dumourier : but, so far as he had proceeded hitherto, Mr. Paine was undoubtedly the best writer in the world.

You will easily believe, that I willingly dropped this conversation at the entrance of our dinner.

When we left the house, to proceed on our journey, he followed us. The servant, who should have bridled our horses, was missing : and we were obliged to perform that office for ourselves. Upon this, our companion, assuming an air of dignity, began a dissertation on the negligence, and inattention, of innkeepers' servants. In all his travels, he observed, he had found no inconvenience so constant, and so great, as this. Every where it was the standing character of servants to avoid the performance of their duty ; and to fail of attending to travellers, or their horses. Often had he met with this scandalous neglect during his own travels ; and been obliged, as we now were, to perform such menial offices for himself.

With the history of this personage I afterwards became accidentally acquainted ; and I will give it to you succinctly. He was born in a small village, in Massachusetts ; and was educated in a plain

farmer's family, and a parochial school. When he had grown to the size of a man, he enlisted himself in a corps of the American recruits, as a fifer; and marched with them to Elizabethtown in New-Jersey. Here his military career ended; and he came back to his native village with a whole skin. His next excursion was to a town in this neighbourhood; where he professedly addicted himself to the study of law. As soon as he thought the attempt safe, he offered himself as a candidate for admission to the bar; and was rejected. Soon after this, if I mistake not the date, he embarked in an enterprise, much more congenial to his character. A man, who had lately died in the neighbourhood, had by will distributed to his oldest son a portion of his estate, which the youngest thought greater than his proper share. In the cause of the discontented brother our politician ardently engaged; and undertook with the disinterested feelings, produced by the promise of a very liberal compensation, in case he should succeed, to persuade the elder brother to make a more equitable division of the property. The manner, in which he pursued this design, was, I believe, new. He saw the old gentleman, or dreamed that he saw him, (for it was impossible to tell which was the fact,) enter his bed-chamber in the night; and held a long conversation with him concerning the manner, in which he had devised his estate to his sons. The old gentleman declared, that ever since he had left the world his conscience had reproached him for the inequality of the distribution; and that he had now come back for the purpose of disburdening his own mind, and doing justice to his children. He directed our hero, therefore, to go to the rich brother, and tell him, that, if he valued his father's pleasure or peace, he must make a more equal division of the property, and resign a part of it to his brother.

The next morning our gentleman appeared with a solemnity of aspect and deportment, calculated to excite in those around him a curious and solicitous attention. To their numerous inquiries he answered in mysterious hints, fitted to sharpen curiosity, and awaken a general, and deep, concern. When this part of the plot had been sufficiently acted, he gradually, and reluctantly, gave way to their importunities; and disclosed in parcels the

events of his vision. The subject soon engrossed the conversation of the neighbourhood; and by the partisans of the dissatisfied brother was seized on with zeal. When the business had acquired sufficient importance, and celebrity, he went to the eldest son; and with great form, and solemnity, delivered the message of his father. But, upon being questioned concerning the certainty, and evidence, of his story he appealed, for proof, to his knowledge of this brother at first sight; roundly declaring, that he had never seen him before; and to his knowledge of several facts, respecting the distribution of the estate, which, he said, could not possibly have been known to him, unless immediately revealed by his father. In this appeal our adventurer was unhappy. The facts, to which he had appealed, and which he had learned imperfectly from his employer, he had misstated; and the brother most unluckily remembered, that, some time before, he had been at his house; and therefore could not fail to know him without the aid of revelation. All this he proved so unanswerably, that our adventurer, although vested with a preternatural commission, and incased with a preternatural covering of brass, was struck dumb. As he left the house, the gentleman requested him, the next time he saw his father to present his best respects to him; and entreat him, when he sent another message, to make a better story, and send it by a better hand. The catastrophe of the plot flew before him. He had already rendered himself odious, and contemptible, to many of his neighbours by the little mischiefs of pettifogging. The pressure of public indignation soon became so great, that he was obliged to decamp, and seek a refuge in Bartlett. Here he quitted law, and devoted himself to theology; assumed a demure countenance, and grave demeanor; professed a high respect for religion; and declaimed on its doctrines in all companies. After a long prelude of seriousness, and zeal, he offered himself, as a communicant, to a society of Baptists: but his character was so suspicious, and so notorious, that they refused to receive him. He determined however, to persevere: and it is said, that, influenced by his sober face, his zealous professions, and his copious harangues on reli-

gious subjects, which he carefully adapts to their prejudices, they have begun already to regard him less unfavourably, and will probably pronounce him, ere long, entitled to their charity. With an appropriate consistency of character, he has at the same time become a partisan of France, and an enemy to Washington. As he has neither property, nor business; goes continually from house to house; declaims every where; and decides, like an oracle, on every subject: he will undoubtedly lead into folly, and wickedness, the ignorant, the modest, and the unsuspecting.

You have here a miniature picture of a demagogue. "Ab hoc uno disce omnes." Some of them have greater, and some of them, perhaps, even less, advantages than this man: but the spirit, by which they are all actuated, the objects, at which they aim, and the moral nature of the means, by which they endeavour to accomplish them, are exactly the same.

After dinner we proceeded to Conway, through a good road. In our way we crossed the Saco; and found it about sixty yards in breadth; rapid; and, although the season was dry, so deep, as nearly to reach our stirrups. Twenty-five miles above, I stepped across it easily. The water was so pure, as to lessen its depth to the eye, at least one half.

Conway lies in a large bend of this river. Here the mountains first recede so far, as to leave on the North side of the Saco, a sufficient opening for a township. The lands, principally, are either pine-plains, or intervals: the latter extensive, and valuable. The inhabitants appeared to be in comfortable circumstances: and the houses were decent. The town contains a single Congregation, who celebrate divine service, alternately, in two churches, harmoniously erected for the accommodation of two settlements, which include the body of the inhabitants. This is the second instance, which I have found of such a fact in New-England.

Conway was incorporated in 1765. In 1775, it contained 273 inhabitants; in 1790, 574; in 1800, 705; and, in 1810, 1,080. Conway is the Northernmost township in the County of Strafford. Here, for the first time, we saw the Norway pine.

On the 4th of October we were detained by a violent storm. The next morning, the mountains behind us were seen in a very advantageous view. All the nearer, and lower summits, were blue, and misty. But Mount Washington, illumined by the Eastern sun, shone with a glittering white: having been covered with snow by the tempest of the preceding day. The deep shadows cast by the projecting cliffs, enhanced the lustre. On the highest point awfully brooded a cloud, tossed into wild and fantastical forms; and seemed to be the connecting link between the earth and the heavens.

I am, Sir, yours, &c.

## LETTER XVI.

Fryburgh—Hiram—Observations on Mount Washington—Standish—Gorham—  
Falmouth.

*Dear Sir,*

We left Conway on the 5th, and rode to Standish, forty-two miles. Fryburgh was the only town in our way: the first in the District of Maine. The township of Fryburgh lies on both sides of a remarkable bend in Saco river, extending in its circuit, as I was informed, more than thirty miles, and returning within seven miles of its former course. Its length, including all its windings before it enters Fryburgh, is about forty miles. The circuit of the bend is, I suspect, exaggerated: but it extends probably more than twenty miles. It is all included within this township; the chief part of which is surrounded by it. The rest is a margin on its exterior. The situation of the township is therefore pleasant. That of the town is less inviting: being a sandy level. The houses are generally very decent. It contains a church; and an academy, incorporated in the year 1792, and endowed with a tract of land in this District, containing, in 1800, 147 inhabitants. It is said to be in a flourishing condition.

Fryburgh was incorporated in 1777; and is included in the County of York. In 1790, the number of its inhabitants was 447; in 1800, 734; and, in 1810, 1,004. It now belongs to the County of Oxford.

We dined at Hiram; a location twenty miles from Conway, but were late: the Saco having been so much swollen, that we were not able to cross at the usual ford. The country from Fryburgh to Standish is composed, to a small extent, of marshes; principally of white and yellow pine plains; and partly of what are here called swells, i. e. hills, occupying a considerable extent, and of such moderate acclivities, as to be easily cultivated. The white-pine plains are of stiff loam; cold, but capable of being enriched by agriculture. The swells are moderately good

grazing ground. Most of this tract, unless I am deceived, will remain forested, until the other countries, within the reach of New-England emigration, are filled up.

Hiram is extensively formed of swells; and appears to possess a desirable soil. We passed by a wheat field in stubble, which, as we judged, must have yielded at least twenty bushels an acre. This location contained, in 1800, 134 inhabitants; and, in 1810, 336.

On a hill in this location we had a most interesting prospect of the White Mountains, at the distance of forty-two miles, measured on the road. Here they appeared, in connection with the heights in their neighbourhood, as a long range of proud eminences; the loftier elevations of which covered with snow, majestically, and gradually, declined from the sight. In the centre, Mount Washington, white and glittering, alternated with strong dark shadows, looked down upon these mountains, as they did upon the world beneath. On the highest point rested a cloud, wild and tumultuous. The day was fair and pleasant; the wind North-West; and the clouds floated in an elevated region of the atmosphere.

The reasons, why these mountains have that white appearance, whence they have derived their name, are two. First, that during nine, ten, and sometimes eleven, months of the year, their summits, particularly that of Mount Washington, are covered with snow. Secondly. In almost all clear days, the only times, in which they can be distinctly seen at great distances, white, fleecy clouds, resting upon them, give them a white aspect, whenever they are seen at such distances. When viewed from a neighbouring position, they are always, except where snow lies, or the rocks are naked, shrouded in a misty azure.

The height of these mountains has been a subject of much dispute. Doctor Williams, all whose remarks on physical subjects merit consideration and respect, supposes the summit of Mount Washington to be about 7,800 feet above the level of the ocean; 72 feet below the point, which in the latitude of  $44^{\circ} 15'$ , (that of these mountains,) is the estimated point of perpetual

congelation on the Eastern continent. This point, he says, from the greater coldness of the American climate, cannot exceed, but must rather fall something short, of what it is in the European climate. The climates of America are, indeed, colder than those of Europe, in the same latitude, during the winter : but in the summer they are generally much hotter. Nor are the mountains in any part of New-England of sufficient height, and extent, to lessen materially the degree of heat, generally prevailing. The air on the summit of Mount Washington must, therefore, continually be rendered less cold, by the ascent of the intensely heated atmosphere from subjacent regions. As the whole country partakes of this heat, the ascending volume, whencesoever derived, must be heated to nearly the same temperature. It seems scarcely credible, therefore, that the temperature of the atmosphere around the single point of Mount Washington should not, during the summer, be sensibly raised by the general heat of the country : for we are to remember, that this is the only height in the United States, which approximates near to the region of perpetual frost.

The conclusion, that a given elevation in every country, lying under the same climate, is the limit of perpetual congelation, has been hastily drawn ; and certainly rests on too few observations. It may be just ; but in the present state of science, it will be difficult to prove it to be just.

On the summit of Mount Washington there is usually little or no snow. That, which is so long visible in the regions below, is blown from the summit, and the North-Western side ; and lies on the Southern and South-Eastern only ; where it is defended from every cold wind by the precipice above, and exposed through June, July, and sometimes a part of August, to the full strength of the sun. Doctor Williams observes from Doctor Belknap, that the snow, although it sometimes covers these mountains in September, goes off again ; and is seldom fixed till the end of October. In 1797, the year in which this journey was taken, the snow descended on them, the 26th of September ; and continued through the winter. In the year 1803, when I visited

them again, it fell on, or about, the 9th of September. It certainly continued through that month; for I saw it on the 30th. On the 6th of October it fell again. From an early day in September, therefore, it continued until the next summer. The summers of both these years were very warm.

The Rev. Mr. Little of Kennebunk ascended Mount Washington in the middle of July 1784. The cold, as he informed me, was then so severe, that he was unable to carve, on the rocks, more than one of the initials of his name, until he had warmed his hands anew, although he was provided with the most convenient instruments for this purpose.

Doctor Belknap, speaking of this expedition, says, that when Doctor Cutler, who was one of the company, had taken a thermometer out of his bosom, when it stood at fever heat, it soon fell to  $44^{\circ}$ ; and that during the time, while he was adjusting a barometer, and thermometer, the cold nearly deprived him of the use of his fingers.

Doctor Cutler fixes the height of Mount Washington at 10,000 feet above the level of the ocean. Doctor Belknap supposes, that it will exceed this elevation.

It is proverbially asserted, along the Eastern coast, that Mount Washington is distinctly visible thirty leagues from the shore. Doctor Belknap estimates its distance from the sea at sixty-five miles. Portland is at this nearest distance. From this town to the Notch, or to Mount Washington, the distance, measured on the road, is eighty-five miles. The utmost loss cannot, I think, exceed fifteen. The distance from this mountain to Portland is therefore seventy miles. Portland is at least ten miles within the common line of the coast. The distance of Mount Washington from the coast is, therefore, eighty miles. But, if we suppose the estimate of Doctor Belknap correct, Mount Washington will be seventy-five miles from the common line of the coast. If then it is seen thirty leagues, or ninety miles, at sea; it is visible at the distance of one hundred and sixty-five miles. This number I will reduce to one hundred and forty. The elevation of this summit, calculating upon its visibility at this distance, and

making the proper allowance for the refraction of light, will be 12,729 feet. Another deduction ought, however, to be made for the fact, that, instead of being seen at the surface, it probably is always first perceived at mast-head.

From the Notch, throughout the first two miles, it is almost every where so steep, as to make riding on horse-back seriously inconvenient: and the Saco is for sixteen miles a perpetual cascade. It is every where a very rapid river; and passes over seven falls: two of them forty feet in height. Its length is about one hundred and ten miles. The elevation of Mount Washington above its fountains cannot, I think, be materially less than a mile and a half.

The following observations of Doctor Cutler exhibit the state of vegetation on these mountains.

“ At the base of the summit of Mount Washington the limits of vegetation may with propriety be fixed. There are indeed on some of the rocks, even to their apices, scattered specks of a mossy appearance; but I conceive them to be extraneous substances accidentally adhering to the rocks: for I could not discover, with my botanical microscope, any part of that plant regularly formed. The limits of vegetation at the base of this summit are as well defined, as that between the woods, and the bald and mossy part. So striking is the appearance, that at a considerable distance the mind is impressed with an idea, that vegetation extends no farther than a line, as well defined, as the penumbra, and shadow, in a lunar eclipse. The stones, that I have by me from the summit, have not the smallest appearance of moss upon them.

There is evidently the appearance of three zones. 1. The woods. 2. The bald, mossy part. 3. The part above vegetation. The same appearance has been observed on the Alps, and all other high mountains.

I recollect no grass on the plain. The spaces between the rocks in the second zone, and on the plain, are filled with spruce and fir, which perhaps have been growing ever since the deluge; and yet many of them have not attained a greater height than

three or four inches : but their spreading tops are so thick, and strong, as to support the weight of a man, without yielding in the smallest degree : the snows, and winds, keeping the surface, even with the general surface of the rocks. In many places on the sides, we could get glades of this growth, some rods in extent, when we could, by sitting down on our feet, slide the whole length. The tops of the growth of wood were so thick and firm, as to bear us currently a considerable distance before we arrived at the utmost boundaries, which were almost as well defined, as the water on the shore of a pond. The tops of the wood had the appearance of having been shorn off, exhibiting a smooth surface, from their upper limits to a great distance down the mountain."

The country between Hiram and Standish presents little to engage the attention of a traveller, except the cataracts of the Saco. Several of these announced their proximity to us, while we were on the road, by their majestic sound. One of them we examined. The Saco is here a large river. The rocks, which obstruct its current, form a ledge, forty feet in height ; and are so rudely thrown together, as to give the cataract all the advantage of the wild, tumultuous, and masterly workmanship of nature. The force and grandeur were very great, mingled with the various, and striking, beauties of a cascade. A cloud of mist ascended from below, finely coloured with the hues of the rainbow.

We reached Standish in the evening.

The settlement of this township commenced about the year 1760. It was incorporated in 1785 ; and contains about 200 families, and one congregation. The number of inhabitants in 1790 was 716 ; in 1800, 1,226 ; in 1810, 1,378. Standish lies in the County of Cumberland, on its Western boundary.

The land in this township is that, which is here called *hard-wood land* ; or land, producing oak and other kinds of wood, which are called hard, in opposition to pine, and other soft kinds. The soil is so exactly distinguished by the forest vegetation, that to say land produces hard, or soft wood, is equivalent to saying, that the soil is good, or bad. This soil, after leaving New-Hampshire, we first saw in Hiram : and there found the first oaks, after

leaving Bath. Antecedently to the year 1784, the inhabitants made no serious attempts to cultivate their ground. Until that time they firmly believed their climate to be so unfavourable, and their soil so sterile, that all efforts of this nature must be fruitless. By some considerations, or other, they were induced to make a single trial; but with a strong apprehension, that they were labouring in vain. They sowed, and planted, their fields; and were not a little surprised to find them, at the usual period of harvest, covered with good crops. Since that time they have regularly applied themselves to agriculture; and with success. They cultivate wheat, but not in great quantities. Maize succeeds well. Apple-trees are numerous, and thrifty; and pear-trees grow without difficulty. The houses were in general ordinary.

Friday, October 6th, we left Standish and rode to Portland, through Gorham, eight or nine miles; Falmouth, seven; Portland, three: in all eighteen or nineteen.

Gorham is a large township of farms. It was incorporated in 1764; and contained in 1790, 2,244 inhabitants; in 1800, 2,503; and in 1810, 2,632. The surface is formed of hills and vallies; and the soil is good. The houses are better than in Standish. In the neighbourhood of the church, a large bulding of an indifferent appearance, there is a small village.

Farming commenced in this township about the same time, as in Standish. Originally a great part of the inhabitants employed themselves in the business of getting lumber; i. e. in cutting such forest trees, as were suitable for timber, and bringing them to market. Previous to the year 1787, this business had materially declined. The trees which grew at a distance within reach of the market, had been chiefly cut down; and many saw-mills suffered to fall into decay. The lumbermen were without employment: and, as they were accustomed to no other business, their families saw nothing but ruin before them. About the year 1787, several of these men conceived and undertook to execute, the design of rafting logs across a lake, called by my informant Tobacook: the

same, I presume, with Sebacock, or Sebago. This lake\* commences, about three miles North of Standish; and extends about thirteen miles in length, and about nine in breadth. On its Northern and Eastern sides were large, forested tracts, which had never been visited by this class of men. Their first experiments at rafting, (a thing, which would probably have been thought practicable by no other persons,) were so often unsuccessful, that even themselves were discouraged. But the pressure of poverty, and a spirit of hardy enterprise, induced them, though not without some intermissions, to persevere until they finally completed their design. In consequence of this event, logs in immense numbers were brought to market down the river Presumpscot, or Pesumpscot, which issues from this lake. The saw mills were repaired, and put into action: and an extensive commerce was opened from Portland in this useful article.

Falmouth is a large township, formerly including the present Falmouth, Cape Elizabeth, and Portland. It was incorporated in 1718. The name, by which it was most generally known was Casco Bay. The original settlement was made on the site of Portland. By degrees, the interior of the township has been so far filled up, that, exclusively of Portland, and Cape Elizabeth, it contained, in 1775, 2,991 inhabitants; and in 1800, 3,482; and, in 1810, 4,105.

We saw few proofs of commercial business in Falmouth. In a small village, built on an inlet near the shore, there were two vessels on the stocks. The soil appeared to be indifferent; and the means, on which these inhabitants live, are scarcely discernible by a traveller. Cherry trees in considerable numbers were growing in the gardens: the first, which we had found after leaving Haverhill. I was afterwards informed that the soil of Falmouth was generally much better, than that which we saw.

I am, Sir, yours, &c.

\* For a description of this lake see Massachusetts Hist. Col.

## LETTER XVII.

Portland—Its Buildings and Commerce—Attacks from the Indians—Wantonly destroyed by Captain Mowat in 1775.

*Dear Sir,*

WE arrived at Portland before dinner; and after dining called on the Rev. Mr. K. one of the Ministers of this town. He accompanied us through every part of it; and by the aid of his information enabled us to examine with advantage whatever attracted our attention. From the town we proceeded to the fortifications, erected on its North-Eastern skirt. They consist of a battery on the Southern declivity of a hill, and a fort, and citadel, on the summit. The battery looks directly into the harbour; and the fort, which is still, in an unfinished state commands both that, and the neighbouring country.

Portland lies one hundred and twenty-three miles North-Eastward from Boston; and half that distance from Portsmouth. It was incorporated in the year 1786. Formerly it was known by the name of Falmouth: being, in the New-England sense, the town to which that name was given, and the place which it customarily denoted.

It is built on a peninsula, resembling the form of a saddle: the principal part of the houses being erected on the seat. The situation is handsome: the harbour, a beautiful piece of water spreading on the South-East, and the cove, smaller, but scarcely less beautiful, on the North-West. This cove at the time of ebb becomes a pond. A bridge, thrown over the outlet, connects Portland with the main in this direction. The peninsula is universally handsome. The site of the town is an easy, elegant arched slope. The principal streets run parallel with the length of the peninsula; and are crossed by others nearly at right-angles. Like those of most other towns in this country, they are destitute of that exact regularity, both in their position and direction, which would have rendered them entirely beautiful. The houses are new; and many of them make a good appearance. There are

two Congregational, and one Episcopal, churches. But neither these, nor the other public buildings, are remarkable for their appearance.

The situation of Portland is probably as healthy, as any in New-England. The slope, on which it is built, furnishes every where a ready passage for all the water, and the happiest means of keeping the town perfectly clean. Nothing can stagnate here without pains-taking. The air cannot but be sweet. The wells furnish an ample supply of pure and fine water. Accordingly, the inhabitants enjoy as uninterrupted health, as those of any place, of the same size, in the United States.

The harbour is safe, capacious, and rarely frozen. It is sufficiently deep to admit ships of the line. The wharves of no great length, reach to the channel. No American town is more entirely commercial; and, of course none is more sprightly. Lumber, fish, and ships, are the principal materials of their commerce. Several roads from the interior of New-Hampshire, and Vermont, partly made, and partly in contemplation, are opening an extensive correspondence between Portland and these countries. The importance of this fact needs no explanation. An extensive fertile country, which is already settled to a considerable extent, and will soon be filled with inhabitants, will through these channels pour their produce into this town.

The importance of the commerce, carried on in Portland, will be seen in the following table of duties on imports.

Years.	Duties.
1801	\$204,333
1802	157,290
1803	161,295
1804	225,759
1805	299,229
1806	342,909
1807	263,562
1808	37,633
1809	60,309
1810	109,724

The people of Portland exhibit the same pleasing manners, and the same hospitality, which I have mentioned as prevailing along this coast. A traveller cannot easily visit them, without carrying away a very advantageous impression of their character.

On the ground where the fortifications now stand, several persons were employed, about eight or ten years before we arrived here, in proving a number of cannon. One of them burst; and a fragment struck a Danish gentleman, the commander of a ship trading to this country; and terminated his life in four hours. He was an only son; was the sole support of his widowed mother, and two sisters; was connected with a young lady in this town; and was to have been married to her at the close of a voyage, which he was then just ready to commence. He was also a person of distinguished worth, and universally respected by the people of Portland. A great number of persons were standing around him, when he fell; but providentially none of them were injured.

On Saturday, in company with a number of the gentlemen of Portland, we made a delightful excursion to Bangs' island, a few miles down the harbour. The day was very fine, and the company highly agreeable. Our business, professedly, was fishing; in which we were perfectly successful. It is true, we neither caught, nor attempted to catch, any fish; but we made an excellent dinner of very fine ones.

This town, then named Falmouth, began to be settled, antecedently to the year 1676; for in that year about thirty of the inhabitants were either captivated, or destroyed, and the rest obliged to fly for safety to a neighbouring island.\*

In 1689 the savages renewed their attacks on this region, and Colonel Church, a celebrated and successful partisan, heretofore mentioned, was sent to defend it with a body of troops. When he arrived, he found seven hundred<sup>d</sup> French and Indians, assembled on an island, preparing to attack a fort, erected here for the security of the neighbourhood. The enemy, having landed the following night, he attacked, and defeated them; though not with-

\* Hubbard.

out considerable loss on his own side. This battle probably saved the settlements in Maine from absolute ruin.

In the spring of the next year, the savages renewed their attacks upon Falmouth. There were, at this time, three forts in the town. All these, being scarcely capable of defence, fell into the hands of the enemy. One was abandoned; another taken by assault; and the third surrendered. One hundred of the inhabitants were made prisoners: and the town was destroyed. The slain were left unburied until the next year; when they received from Colonel Church such an interment, as was in his power. From this time, the Province of Massachusetts Bay adopted more vigorous measures for the defence of Falmouth; in consequence of which they seem to have enjoyed a general tranquillity.

In the month of October, 1775, Falmouth met with a new and most afflicting disaster. Captain Mowat, the commander of a British sloop of war, who had been often entertained by the inhabitants with much politeness and hospitality, came on shore, very naturally expecting to find again the same welcome reception. You will easily believe that the battles of Lexington and Breed's Hill had materially changed the feelings of the Americans towards such Britons, at least as were personally engaged in hostilities against the country. The inhabitants of Falmouth, however, offered him no incivility. But a Mr. Thompson of Brunswick, with several other persons, all of them strangers, seized him as he was walking on the hill, where the fort now stands; and exhibited a disposition to treat him with severity. This act, unwarranted by any authority, and merely the result of the ardour and violence of the day, was reprobated by the principal inhabitants. Brigadier General Preble and Colonel Freeman, together with several other citizens of Falmouth, having received intelligence of the outrage, went in a body to Thompson, and his associates; and urged them to release Mowat; pledging themselves for his future good conduct. He was released accordingly; but not without much hesitation, and difficulty, on the part of Thompson.

Mowat immediately sailed for Boston; and, seconded by several inhabitants of Falmouth; who, having embarked eagerly in the British cause, had found it convenient to retire to Boston for protection; solicited, and obtained, from Admiral Greaves leave to destroy Falmouth.

On the 18th of the same month he appeared before the town, with his own ship, and several smaller vessels; and informed the inhabitants by a messenger, that he had orders to destroy it. In vain did the people remonstrate against this wanton act of cruelty. In vain did Brigadier Preble remind him of the former civilities of the inhabitants; of the interference of himself, and others, to preserve him from the abuse, to which he was destined by the hands of violent men; and of the pledge, which had been given, for the purpose of accomplishing his deliverance. The only indulgence which they could obtain, was a respite till the next morning. During the night the inhabitants removed such parts of their property, as this little interval permitted them to carry away. Early in the morning the British vessels began to fire on the town; and continued the work of devastation until they had reduced all the public buildings except the Congregational church, one hundred and thirty dwelling-houses, and a great number of out buildings, to ashes. General Preble, whose heart swelled with an indignation, which no words can express, at this violation of all faith and decency, this ungrateful return for his own kindness, this outrageous cruelty towards such a number of people, perfectly innocent, and claiming from Captain Mowat respect, and goodwill for their civilities to him, refused to retire, or take any measures for the security of his person or property, and spent the whole period, while the devastation was going on, upon the ground near the North-Eastern corner of the town, exposed in the most open manner to the shot and shells. Nor could all the solicitations of his friends persuade him to retire. By this wanton and malicious act of revenge about one hundred and sixty families were driven, at a late period of the year, to find an asylum from the winter, in a country thinly inhabited, and inhabited by those, who were ill able to furnish them with the necessary means of

subsistence, or even with a shelter. A great part of their most useful property had been destroyed : and they were left to experience those severe sufferings, which are the usual result of a conflagration.

The story ran through the continent with an electrical rapidity; and produced an universal indignation and horror. Instead of disheartening the inhabitants, it only edged their resentment against the British, and rendered their alienation more complete. Captain Mowat, the author of it has achieved the immortality of Erostratus ; and will be remembered by future generations, as a fiend, and not as a man.

I am, Sir, yours, &c.

## LETTER XVIII.

Story of General Wadsworth—Attack on his house—His capture.

*Dear Sir,*

Among the most respectable inhabitants of this town, from whom we received an uninterrupted succession of civilities, Major General Wadsworth, for many years a member of the American Congress, deserves to be remembered by us with particular respect. The following part of this gentleman's history will, I think, excite in your mind a lively interest.

After the failure of the expedition against the British garrison at Penobscot, General Wadsworth was sent, in the spring of 1780, by the Legislature of Massachusetts to command in the District of Maine. The principal objects of his mission were to retain the inhabitants in their allegiance, and in their attachment to the American cause, and to obstruct the efforts of the enemy. In these employments he spent the summer of 1780, and the principal part of the following winter. Before the end of February he dismissed his troops; the period of their enlistment being finished; and began to make the necessary preparations for his return to Boston. Mrs. Wadsworth, and a friend of hers, Miss Fenno of Boston, had accompanied him, and continued here till this time.

His preparations for returning could not escape notice. A neighbouring inhabitant, hostile to the American cause, had attentively observed his motions, and announced his design to the commander of the British fort; observing, that, if he seized the present moment, he might make General Wadsworth a prisoner; that he was defenceless, having only six soldiers under his command; that he would speedily leave the country; and that the least delay would frustrate this important object. The British commander listened eagerly to the intelligence; and immediately sent a party of twenty-five soldiers, with their officers, to attack the house, in which he lodged. They embarked in a small

schooner, already equipped for a cruise ; and proceeded to an inlet, four miles from the General's quarters, called West South River. Here they arrived at the beginning of the evening ; and lay concealed in the house of one Snow, a Methodist preacher ; professedly a friend to him, but really a traitor ; until 11 o'clock. The ground was covered with snow ; and the weather severely cold. The surface, in the neighbourhood of the house, was hilly. An enemy could therefore advance within a few rods, without being discovered. For this reason the sentinel at the door was regularly ordered to fire his piece at the appearance of an enemy, and to escape without attempting to enter the house : as any effort of this nature would enable the enemy to enter at the same time.

The party came suddenly upon the sentinel, who gave the alarm by crying, "Who is there?" His comrades instantly opened the door ; and as he went in, the enemy fired a volley into the kitchen, which was the soldier's guard room, and entered it together with the sentinel. Another party of them at the same instant fired through the windows of the room, in which the General and his lady slept ; and blew the windows in. A third, at the same moment, forced their way through the windows ; and took possession of the room, in which Miss Fenno lay. Thus they were masters of the whole house, except the room, where the General lay, which was strongly barred. The British officers, finding nobody in Miss Fenno's room, beside her and Mrs. Wadsworth, who, hastily dressing herself, had escaped into it, ordered the firing there to cease.

General Wadsworth had a pair of pistols, a blunderbuss, and a fusee. With the pistols, which he had discharged several times, he had defended the windows of his room, and a door, which opened into the kitchen ; and prevented the assailants from entering. He now heard their feet advancing through the front entry ; and snapped his blunderbuss at them. They retreated. He snapped it again at several of the soldiers, who were forcing their way through the pannel of the kitchen door. These retreated also. He then seized his fusee ; and discharged it upon

some others, who were breaking through one of the windows. These also fled. The attack was then renewed through the entry. Against this he defended himself with his bayonet. His linen discovering him to the soldiers in the kitchen, they fired at him; and one of their balls went through his left arm, and terminated the contest.

Upon his announcing, that he would surrender, the firing was ordered to cease. The soldiers, however, continued to fire from the kitchen. General Wadsworth, unbarring the door, and opening it, said, "My brave fellows, why do you fire after I have surrendered?" The soldiers rushed into his room; and one of them, who had been badly wounded, exclaiming with an oath, "You have taken my life, and I will take yours," pointed a musket at his breast. The commanding officer, who had entered the room through the other door at that moment, struck the musket with his sword, and saved the General's life. One of the officers now brought a candle from Miss Fenno's room; and exclaimed, "Sir, you have defended yourself too well; you have done too much for one man. You must excuse haste. Shall we help you on with your clothes? You see, we are in a critical situation." The soldiers were ordered out to parade before the door. The General's clothes were soon put on, except his coat; which his wounded arm rendering it impossible for him to wear, it was committed to a soldier. Mrs. Wadsworth, and Miss Fenno, came into the room; and, suppressing their intense emotions with admirable fortitude, proposed to examine the General's wound. This, however, the haste of the party prevented. Mrs. Wadsworth threw a blanket over him: and Miss Fenno tied a handkerchief very closely around his arm, to check the copious effusion of blood. A soldier then took him out of the house. He was much exhausted; and, supposing that the ball had cut an artery, told the officer, he would not carry him far. Fortunately, however, the blood, being congealed by the cold, and stayed by the bandage, ceased to flow; and his strength and spirits speedily returned.

The party withdrew in great haste ; and increased their expedition, in consequence of the report of a musket, fired at no great distance on the other side of the river. The two wounded British soldiers were mounted on a horse, taken from General Wadsworth's barn. The General himself, and a wounded American soldier, were on foot ; but were aided in their march by their captors. When they had proceeded about a mile, a number of persons, who had gathered at a small house on the way, and who had seen the party when they went out, hailed them ; and asked whether they had taken General Wadsworth. They said no : and added, that they wished to leave a wounded man with them ; that, if they took good care of him, they should be well paid ; but, if not, that they would come, and burn their house. The wounded man, apparently dying, was then carried into the house ; and General Wadsworth, after being warned, that his safety depended upon his silence, was set on the horse behind the other wounded soldier. A part of their course lay over a frozen mill-pond, about a mile in length. At the head of this pond they were met by some of the party, who had been left behind, to take care of the Methodist preacher's house. These, having learned the success of the enterprise, hurried back to the privateer ; to carry the news. When the party reached the privateer, some were overjoyed, and others swore bitterly. The Captain, particularly, was in a rage, on being informed, that he must return with his privateer to the fort ; and, instead of sending the prisoner by a small boat, as had been originally proposed, must convey him in his vessel. Seeing some of his men wounded, he demanded, with a furious voice how he, the General, dared to fire on the King's troops ; damned him for a rebel ; and ordered him to go, and help launch the boat : declaring, that, if he did not, he would put his hanger through his body. General Wadsworth coolly answered, that he was a prisoner ; was badly wounded ; and could not assist in launching the boat ; however he might think proper to treat him.

The commanding officer had gone into the house, to take some refreshment ; but, hearing of this abusive behaviour of the Cap-

tain, returned immediately ; and, in a manner very honourable to himself, told the Captain, that the prisoner was a gentleman, had made a brave defence, and was to be treated accordingly. At the same time he informed him, that he must return with his privateer to Bagaduce; (the point on which the British fort stood ;) both on account of the prisoner, and of his own wounded men ; and must therefore embark his own people, and the party, immediately. He added further, that his conduct should be represented to General Campbell as soon as he arrived. The poor Captain, thunder-struck with this denunciation, lost his importance in a moment. The men were embarked ; the stern of the boat was given to the General ; and, after they had gone on board, the best cabin, and the most comfortable things which the vessel could afford.

The General's arm was now benumbed, rather than painful. The vessel was soon under weigh : and a cold Northern wind drove her with such violence, as seriously to incommode General W. and his fellow-sufferers.

I will now return to the ladies, who were left behind in their desolated house. Not a window in this habitation escaped the destruction. The doors were broken down ; and two of the rooms were set on fire. The floors were drenched with blood : and on one of them lay a brave old soldier, (through whose arm, near the shoulder joint, had been driven the whole charge of a musket ; consisting of a wad, powder, and ball ;) begging for death, that he might be released from his misery. To add to the sufferings of these unfortunate ladies, a number of the neighbouring inhabitants, having heard of the disaster, flocked in, and filled the house. Here they did nothing but gaze about with an idle curiosity, or make useless, numerous, and very troublesome, inquiries. Scarcely any thing could be more wearisome, or more provoking. At length the ladies assumed resolution enough to reprove them with some severity ; and thus restored them from the stupor, produced by these novel and disastrous events, to thought, feeling, and exertion. As soon as they had fairly recovered themselves, they very cordially, and kindly, united their efforts to render the

best offices in their power. The next morning they repaired the doors and windows; cleansed the floors; dressed the wounded man in the best manner in their power; and placed the family in as comfortable circumstances, as the case would admit.

You will easily believe, that the solicitude of both General Wadsworth, and the ladies, particularly of Mrs. Wadsworth was extreme. What an affectionate wife must feel for a husband, situated as he was, nothing but the experience of such a wife, in such circumstances, could enable even the female heart to realize. To all his other distresses was added, in the mind of the General, the most excruciating anxiety concerning his little son: a boy of five years old. This child, and a sister younger than himself, slept with a maid in the bed-room; directly in the range of the enemy's first discharge into the kitchen. As the General was leaving the door, after he had been made a prisoner, the maid came to it with the younger child: but he could not recollect that he had seen his son, after the onset. This, he thought, could scarcely have happened, unless the child had been killed.

Near the close of the day, the privateer approached the place of her destination. The signal of success was made; the capture of General Wadsworth announced; and the shore thronged with spectators, to see the man, who through the preceding year had disappointed all the designs of the British in this quarter. They were composed of Britons, and American refugees, of every class. David has often deprecated in the most pathetic manner the triumph of his enemies. General Wadsworth was now furnished with an opportunity of realizing the import of the language, and entering deeply into the feelings of the Psalmist.

The General left the privateer amid loud shouts of the rabble, which covered the shore; and was conducted to the house of a very respectable refugee, until a report concerning the success of the expedition should be made to General Campbell; the Commandant of the post; and his orders should be received.

A guard soon came, with orders to bring the prisoner to the guard room, within the fort; which was about half a mile from the landing. A guard, even of an enemy, was to him a very desirable

accompaniment at the present time: for among those, who were around him, there were many persons, from whom, in these circumstances, he had nothing to expect, but abuse. When he arrived at the fort, he was conducted into the officers' guard-room; and was treated with politeness. Soon after, General Campbell sent a messenger to General Wadsworth with his compliments; informing him, that his situation should be made as comfortable, as it could be; and that a surgeon should attend him immediately, to dress his wound. The surgeon soon came; and upon examination found the joint of the elbow uninjured, and pronounced the wound to be free from danger, if the artery was unhurt. This, he said, could not be determined, until a suppuration had taken place. After the wound had been dressed, and supper served, General Wadsworth retired to rest. In the morning the Commandant sent an invitation to him to breakfast with him; and at table paid him very handsome compliments on the defence, which he had made, observing however, that he had exposed himself in a degree not perfectly justifiable. His guest replied, that from the manner of the attack, he had no reason to suspect any design of taking him alive; and that he intended, therefore, to sell his life as dearly as possible. "These things," said General Campbell, "are very natural to gentlemen of our profession. But, Sir, I understand that the Captain of the privateer treated you very ill. I shall see that matter set right." He then informed his guest, that a room in the officers' barracks, within the fort, was prepared for him; and that he should send his orderly sergeant daily, to attend him to breakfast, and dinner, at his table; where a seat would always be reserved for him, whenever he chose to accept of it. This polite proffer was followed by other observations, of the same general nature; after which General Wadsworth withdrew to his quarters.

He was now alone. He was a prisoner. The ardour of enterprise was over. He had no object to engage his attention; no plan to pursue; no motive to excite an effort, or even to rouse a vigorous thought. The calm, sluggish course, became absolutely dead, when contrasted by his mind with the storm of war, which

had just passed over. General Campbell, probably foreseeing that such must be his prisoner's situation, sent him in the course of the forenoon several books of amusement ; and then calling upon him in person, endeavoured by cheerful conversation to make the time pass agreeably.

Not long after, the officers of the party came in to inquire concerning his situation ; and, while they were present, appeared the redoubtable Captain of the privateer. He told General Wadsworth, that he called to ask pardon for what had fallen from him, when in a passion ; that it was not in his nature to treat a gentleman prisoner ill ; that the unexpected disappointment of his cruise had thrown him off his guard ; and that he hoped, that this would be deemed a sufficient apology. General Wadsworth accepted it ; and his visitors withdrew. Neither books, nor company, however, could prevent the forenoon from being tedious and long. "Remembrance," in spite of amusement, would "wake with all her busy train." Anticipation, sometimes her very restless and intrusive companion, would present melancholy pictures ; and whisper prophecies of suffering and sorrow. About four o'clock P. M. the orderly sergeant, presenting the compliments of the Commandant, summoned General Wadsworth to dinner. He accepted the invitation, notwithstanding his sufferings ; and particularly, as he had a wish to see the guests. They were numerous ; and consisted of all the principal officers of the garrison. Their conversation was evidently guarded, but delicate ; and particularly polite to the stranger. His arm, however, began to be painful : and having satisfied his curiosity, he respectfully withdrew.

The first object, which now seriously engaged his attention, was to obtain some knowledge concerning the situation of his wife and family, and to communicate his own to them. For this purpose he wrote, the next morning, a billet to the Commandant ; requesting, that a flag of truce might be sent to a militia officer in Camden ; a town on the South-Western skirt of Penobscot bay, not far distant from Bagaduce ; with a letter to the Governor of Massachusetts, and another to Mrs. Wadsworth. The request

was immediately granted, on the condition, that the letter to the Governor should be inspected. To this General Wadsworth made no objection. The letter contained nothing, but an account of his own situation, a request, that an exchange might be speedily effected in his favour; and an exhibition of the obliging manner, in which he had been treated, since he had been made a prisoner. The letter was perfectly acceptable to the British Commander.

The flag was given to Lieutenant Stockton; the officer by whom General Wadsworth had been taken prisoner. As soon as the weather permitted, he set out for Camden in a boat; and within a fortnight from the disastrous night, mentioned above, returned with a letter from Mrs. Wadsworth. This letter to his great joy informed him, that his wife and family were in more comfortable circumstances, than he had been prepared to imagine, and particularly, that his son was alive. The child had slept through the whole of that dreadful night; and knew nothing of the family sufferings, until the next morning.

This fortnight had been a painful one to General Wadsworth. The increasing inflammation of his wound had confined him entirely to his room: and the sudden transition from domestic happiness to a gloomy solitude, and from liberty to a prison, admitted of few consolations. General Campbell, continued his attention to him for some time. About half of the officers in the garrison called upon him as often, as propriety permitted. Their conversation, in which political discussions were carefully avoided, was intentionally made as agreeable to him, as might be. They also sent him in succession a variety of entertaining books. Upon the whole, the connection formed between him and them became not only pleasant, but interesting.

At the end of five weeks, his wound was so far healed, that he was able to go abroad. He then sent to General Campbell a note, requesting the customary privilege of a parole. The request was not granted. The reasons assigned were, that it would be unsafe for General Wadsworth to expose himself to the hostility of the refugees, some of whom were his bitter enemies; that

the garrison might be endangered by the inspection of a military man ; and particularly, that General Campbell had reported his situation to the Commanding officer at New-York, and must therefore receive his directions, before he made any alterations in the circumstances of the prisoner. These reasons had weight : and General Wadsworth acquiesced. At the same time he was permitted to take the air in pleasant weather, by walking some time, every convenient day, on the parade within the fort, under the care of the officer of the guard. In these walks he was attended by two centinels ; and accompanied by some of the officers of the garrison. These little excursions were very favourable, both to his health, and spirits. Upon the whole, to use his own language, his confinement became tolerable.

In about two months, when the mild season was approaching, and began to relax the chains of winter, Mrs. Wadsworth, and Miss Fenno, under the protection of a passport from Gen. Campbell, arrived at Bagaduce ; and were conducted with much civility to his quarters. General Campbell, and many of his officers, cheerfully contributed their efforts to render the visit agreeable to all concerned. It continued ten days. In the mean time an answer, or rather orders, had arrived from the Commanding General at New-York. This General Wadsworth augured from the change of countenance in some of the officers. The import of the orders was intentionally concealed from Mrs. W. and Miss F. But, Miss F. had accidentally learned their nature by a hint, which fell from an officer, occasionally at the General's quarters, and indicated that he was not to be exchanged, but to be sent either to New-York, or Halifax, or some other place in the British dominions. This information she carefully concealed, until the moment of her departure ; when, to prevent Mrs. W. from suspecting her design, she barely said with a significant air, "General Wadsworth, take care of yourself." The weather being fine, the ladies re-embarked ; and without any serious misfortune landed, the second day, at Camden.

I am, Sir, yours, &c.

## LETTER XIX.

Story of General Wadsworth concluded—Major Burton.

*Dear Sir,*

Soon after the departure of the ladies, General Wadsworth was informed, that a parole could not be given to him, because some of the refugees had communicated unfavourable information concerning him to the Commander in Chief at New-York. From this time, General Campbell withheld his civilities. Other officers in the garrison however visited him daily; treated him with polite attention; and beguiled by various amusements the tedious hours of his captivity. He learned from the servants who attended him, that he was not to be exchanged, but sent to England, as a rebel of too much consequence to be safely trusted with his liberty.

Not long afterwards, about the middle of April, *Major Benjamin Burton*, an agreeable, brave, and worthy man, who had served under General Wadsworth the preceding summer, was taken, on his passage from Boston to St. George's river, the place of his residence; brought to the fort at Bagaduce; and lodged in the same room with General Wadsworth. Burton confirmed the report of the servants. He had learned from a source which he justly regarded as authentic, that both himself and the General were to be sent, immediately after the return of a privateer, now out upon a cruise, either to New-York or to Halifax; and thence to England. There they were to remain prisoners until the close of the war; and were to be treated afterwards, as circumstances should direct. This intelligence, thus confirmed, explained at once the monitory caution of Miss Fenno; and perfectly exhibited to General Wadsworth the importance of *taking care of himself*.

The gentlemen were not long in determining, that they would not cross the Atlantic as prisoners. They resolved, that they would effect their escape, or perish in the attempt. When an

enterprise, bordering on desperation, is resolutely undertaken, the means of accomplishing it are rarely wanted.

It must, however, he admitted, that scarcely any circumstances could promise less than theirs. They were confined in a grated room, in the officers' barracks, within the fort. The walls of this fortress, exclusively of the depth of the ditch surrounding it, were twenty feet high; with fraising on the top, and Chevaux-de-frise at the bottom. Two sentinels were always in the entry; and their door, the upper part of which was a windowsash, might be opened by these watchmen, whenever they thought proper; and was actually opened at seasons of peculiar darkness and silence. At the exterior doors of the entries sentinels were also stationed: as were others in the body of the fort, and at the quarters of Gen. Campbell. At the guard-house a strong guard was daily mounted. Several sentinels were daily stationed on the walls of the fort: and a complete line occupied them by night. Without the ditch, glacis, and abattis, another complete set of soldiers patrolled through the night also. The gate of the fort was shut at sunset: and a piquet guard was placed on, or near, the isthmus, leading from the fort to the main land.

Bagaduce, on the middle of which the fort stands, is a peninsula, about a mile and a half in length, and a mile in breadth; washed by Penobscot bay on the South, Bagaduce river on the East, on the North-West by a broad cove, and throughout the remainder of the circle by the bay and river of Penobscot. A sandy beach, however, connects it with the main land on the Western side. From these facts the difficulties of making an escape may be imperfectly imagined. Indeed, nothing but the melancholy prospect of a deplorable captivity in the hands of an enemy, exasperated by a long and tedious war, carried on against those who were deemed rebels, could have induced the prisoners to take this resolution.

Not long after a cartel arrived from Boston, bringing letters from the Governor and Council to General Wadsworth, with a proposal for his exchange, and a sum of money, &c. for his use. These were carefully delivered to him: but the exchange being,

as General Campbell said, not authorised, he refused to liberate the prisoners. This determination they had expected.

Several plans were proposed by the gentlemen for their escape; and successively rejected. At length they resolved on the following. The room, in which they were confined was ceiled with boards. One of these they determined to cut off, so as to make a hole, sufficiently large for a man to go through. After having passed through this hole, they proposed to creep along one of the joists, under which these boards were nailed, and thus to pass over the officers' rooms, bordering on it, until they should come to the next, or middle, entry; and then to lower themselves down into this entry by a blanket which they proposed to carry with them. If they should be discovered, they proposed to act the character of officers, belonging to the garrison, intoxicated. These being objects to which the sentinels were familiarised, they hoped in this disguise to escape detection. If they should not be discovered, the passage to the walls of the fort was easy. Thence they intended to leap into the ditch; and, if they escaped without serious injury from the fall, to make the best of their way to the cove; on the surface of whose water they meant to leave their hats floating, (if they should be closely pursued,) to attract the fire of the enemy; while they were softly, and silently, making their escape.

Such was their original plan. Accordingly, after the prisoners had been seen by the sentinel, looking through the glass of the door, to have gone to bed, Gen.-W. got up, the room being dark; and, standing in a chair, attempted to cut with his knife the intended opening; but he found the attempt useless, and hazardous. It was useless, because the labour was too great to be accomplished with the necessary expedition. It was hazardous, because the noise, made by the strokes of the knife, could not fail, amid the profound silence, of being heard by the sentinel; and because the next morning must bring on an unpleasant detection. This part of the design was, therefore, given up.

The next day, a soldier, who was their barber, was requested to procure a large gimblet, and bring it with him, when he came the

next time to dress General Wadsworth. This he promised, and performed, without a suspicion, that it was intended for any thing more than amusement. He received a dollar for this piece of civility ; and was sufficiently careful not to disclose a secret, which might create trouble for himself.

The prisoners waited with anxiety for the arrival of the succeeding night. To their surprise, the noise made by the gimblet was such, as to alarm their apprehensions, and induce them again to desist. They were, however, not discouraged ; but determined to make the experiment again during the day, when they hoped the noise would either not be heard at all, or would attract no notice. The *eyes* of the sentinels were now to be eluded ; for the operation must in this case be performed at times, when they might very naturally be employed in inspecting the room. It was necessary, also, to escape the observation of their servants ; who often came in without any warning ; and that of the officers ; who were accustomed to visit them at almost all times of the day. But on these difficulties their persevering minds dwelt, only for the purpose of overcoming them. The two sentinels, who guarded the prisoners, commonly walked through the entry, one after the other, from the front of the building to the rear. This distance was exactly the breadth of two rooms. After they had begun their walk, the prisoners watched them with attention, until they acquired a complete comprehension of the length of the intervals between the moments, at which the sentinels successively passed their door. The prisoners then began to walk within their room, at the same pace with that of their watchmen : the sound of their feet being mutually heard ; and all passing by the glass door the same way, at the same time. The prisoners in this manner took two turns across the room, while a sentinel took one through the entry. This difference of time gave them all the opportunities, which they enjoyed, for using their gimblet.

General Wadsworth, being of the middle stature, could, while standing on the floor, only reach the ceiling with the ends of his fingers. But Major Burton was very tall, and could reach it conveniently ; so as to use the gimblet without the aid of a chair.

This was a very fortunate circumstance; as it saved appearances, and not improbably prevented the discovery, to which they were exposed from so many sources. Accordingly, whilst the garrison was under arms on the parade, and their servants were purposely sent away on errands, the gentlemen began their walk, and passed by the glass door with the sentinels. General Wadsworth then walked on; but Major Burton, stopping short in the proper spot, perforated the ceiling with his gimblet, in sufficient season to join General Wadsworth on his return. Again they passed the door, and returned, as if by mere accident: when the ceiling was in the same manner perforated again. This process was repeated until a sufficient number of holes were bored. The interstices in the mean time were cut through with a pen-knife; the wounds in the ceiling, which were small, being carefully covered with a paste of chewed bread, almost of the same colour with that of the board. The dust, made by the gimblet, was also carefully swept from the floor. In this manner they completely avoided suspicion, either from the sentinels, the servants, or the gentlemen by whom they were visited. In the course of three weeks a board was entirely cut asunder, except a small part at each corner, which was left for the purpose of holding the severed piece in its proper place, lest some accident should open the passage prematurely.

During all this time the prisoners had watched every thing, which related to the return of the privateer, in which they were to be embarked. They had, also, made every unsuspecting inquiry in their power, while occasionally conversing with their visitors, and with the servants, concerning the situation of the exterior part of the fort; the ditch, the position of the Chevaux-de-frisc, the fraising, the posting of the outer sentinels, and piquet-guard. The scraps of information, which were obtained in this cautious manner, General Wadsworth, who was tolerably well acquainted with the place, was able to put together in such a manner, as to form a complete view of the whole ground; to fix with precision the place, where they should attempt to cross the wall; where, if separated by accident, they should meet again; and to determine on several

other objects, of the same general nature. Major Burton, whose first acquaintance with Bagaduce commenced when he was landed as a prisoner, was less able to form correct views concerning these subjects; and laboured, therefore, under disadvantages, which might prove serious.

The privateer was now daily expected. It is hardly necessary to observe, that the prisoners regarded the moment of her approach with extreme anxiety. They wished for a dark, and boisterous night, to conceal their attempt, and to escape from the observation of their guard; but determined, that, if such an opportunity should not be furnished before the return of the privateer, to seize the best time, which should occur. A part of the meat, supplied for their daily meals, they laid up, and dried, and preserved the crust of their bread, to sustain them on their projected excursion. They also made, each a large skewer of strong wood; with which they intended to fasten the corner of a large bed-blanket to one of the stakes in the fraising, on the top of the wall; in order to let themselves down more easily into the ditch.

When their preparations were finished, a whole week elapsed without a single favourable night. Their anxiety became intense. The weather became warm; and the butter, which had been accidentally attached to some of the bread, employed as paste to cover the holes in the ceiling, spread along the neighbouring parts of the board, and discoloured them to a considerable extent. This fact alarmed them not a little; particularly when, their visitors were now and then gazing around the room, in which they were confined. Nor were their apprehensions at all lessened by several incidental expressions of some British officers, which to the jealous minds of the prisoners seemed to indicate, that their design was discovered.

On the afternoon of June 18th the sky was overcast. At the close of evening, thick clouds from the South brought on an unusual darkness. The lightning began to blaze with intense splendour, and speedily became almost incessant. About eleven o'clock, the flashes ceased. The prisoners sat up till this time; apparently playing at cards, but really waiting for the return of

absolute darkness. Suddenly rain began to descend in torrents. The darkness was profound. The propitious moment, for which they had so long waited with extreme solicitude, had, as they believed, finally come, and more advantageously than could have been reasonably expected. They, therefore, went immediately to bed ; while the sentinel was looking through the glass door; and extinguished their candles.

They then immediately rose, and dressed themselves. General Wadsworth, standing in a chair, attempted to cut the corner of the board, which had been left, to prevent the severed piece from falling; but found that he made a slow progress. Major Burton then took the knife; and within somewhat less than an hour completed the intended opening. The noise, attending this operation, was considerable; but was drowned by the rain upon the roof. Burton ascended first; and, being a large man, forced his way through the hole with difficulty. By agreement he was to proceed along the joists, till he reached the middle entry; where he was to wait for his companion. The fowls, which roosted above these rooms, gave notice of his passage by their cackling; but it was unheeded, and perhaps unheard, by the sentinels. As soon as this noise ceased, General Wadsworth put his blanket through the hole; fastened it with a skewer; and attempted with this aid to make his way through the passage, standing in a chair below. But he found his arm weaker, and of less service, than he had expected. He did not accomplish his design without extreme difficulty. But the urgency of the case reanimated his mind, invigorated his limbs; and enabled him, at length, to overcome every obstacle. The auspicious rain, in the mean time, roaring incessantly on the roof of the building, entirely concealed the noise, which he made during this part of his enterprize, and which in a common season must certainly have betrayed him.

When the General had reached the middle entry, he could not find his companion. After searching for him several minutes in vain, he perceived the air, blowing in through the door of the entry; and concluded, that Major Burton had already gone out, and left the door open. He, therefore, gave over the search; and

proceeded to take care of himself. After passing through the door he felt his way along the Eastern side, the Northern end, and a part of the Western side of the building; walking directly under the sheet of water, which poured from the roof, that he might avoid impinging against any person, accidentally in his way; a misfortune, to which he was entirely exposed by the extreme darkness of the night.

After he had reached the Western side of the building, he made his way toward the neighbouring wall of the fort; and attempted to climb the bank: but the ascent being steep, and the sand giving way, he found it impossible to reach the top. He then felt out an oblique path; and ascended to the top; as from his window he had observed the soldiers do, when they went out to man the wall. After he had gained the top, he proceeded to the spot on the North Bastion, where Burton and himself had agreed to cross the wall, if no accident should intervene. When he had arrived at this place, and was endeavouring to discover the sentry boxes, that he might creep between them, across the top of the wall; the guardhouse door on the opposite side of the fort was thrown open; and the sergeant of the guard called "Relief; turn out." Instantly there was a scrambling on the gorge of the bastion, opposite to that, where he now was. This scrambling he knew must be made by Burton. The rain, in the mean time, kept the sentinels within their boxes; and made such a noise on *them*, that they could not hear that which was made by the prisoners. In this critical moment no time was to be lost. The relief guard was approaching. General Wadsworth made all haste, therefore, to get himself with his heavy blanket, across the parapet, upon the fraising, which was on the exterior margin of the wall: a measure indispensable, to prevent the relief from treading on him; as they came round on the top of the wall; and he barely effected it during the time, in which the relief was shifting the sentinels. At the same time he fastened, with the skewer, the corner of his blanket round a picket of the fraising; so that it might hang at the greatest length beneath him. After the relief had passed on, the General with great difficulty, arising particular-

ly from the lameness of his arm, slid with his feet foremost off the ends of the pickets of the fraising; clinging with his arms and hands to the ends; thus bringing himself underneath the pickets, so as to get hold of the blanket, hanging below. Then he let himself down by the blanket, until he reached the corner, nearest to the ground. From this he dropped, without injury, on the berme; and within the Chevaux-de-frise, which lay on the berme. Leaving his blanket suspended from the fraising, he crept into the Chevaux-de-frise, nearest to the spot, where he had descended; and moved softly along to the next angle. Here he remained without noise, or motion, until the relief, having gone round the walls, and out of the gate, to relieve the sentinels without the abattis, should have passed by. As soon as he had heard them pass, and before the sentinels had become accustomed to noises around them, he crept softly down into the ditch; went out at the water course, between the sentry boxes; and descended the declivity of the hill, on which the fort stood, into the open field. Finding himself fairly without the fort, and without the line of sentries, and perceiving no evidence that he had been discovered, he could scarcely persuade himself, that the whole adventure was not a dream; from which he might soon awake, and find himself still in his prison.

Both the rain, and the darkness, continued. He groped his way, therefore, among rocks, stumps, and brush, very leisurely, to an old guard-house on the shore of the back cove. This building had been agreed upon between the prisoners as their place of rendezvous, if any accident should separate them. After searching, and waiting, for his companion half an hour in vain, he proceeded onward to the cove. The time was happily that of low water. Here he drew off his shoes and stockings; took his hat from the skirt of his coat, to which hitherto it had been pinned; girded up his clothes; and began to cross the water, which was about a mile in breadth. Fortunately he found it no where more than three feet in depth. Having safely arrived at the opposite shore, and put on his stockings, and shoes, he found the rain beginning to abate, and the sky becoming less dark. Still he saw nothing of his companion.

It was now about two o'clock in the morning. General Wadsworth had left the fort a mile and a half behind him; and had perceived no noise, which indicated, that the enemy had discovered his escape. His own proper course now lay, for about a mile, up a very gently sloping acclivity; on the summit of which was a road, formerly cut, under his direction, for the purpose of moving heavy cannon. The whole ascent was overspread with trees, blown down by the wind: and to gain the summit cost him the labour of at least an hour. At length he reached the road; but, after keeping it about half a mile, determined to betake himself to the woods, and make his way through them to the river. Here the day dawned; and the rain abated. Here, also, he heard the reveillé beat at the fort. He reached the Eastern shore of the Penobscot, just below the lower Narrows, at sun rise; and found a small canoe at the very spot, where he first came to the river. But he was afraid to cross it in this place, lest the inhabitants on the opposite shore, through fear of the enemy, or hostility to *him*, should carry him back to the fort; or lest their kindness, if they should be disposed to befriend him, should prove their ruin. He, therefore, made the best of his way up the river, at the foot of the bank; and kept as near, as he could, to the water's edge; that the flood tide, which was now running, might cover his steps, and prevent his course from being pursued by blood-hounds, kept at the fort. In this manner, also, he escaped the notice of the inhabitants, living on the Eastern bank of the river.

About seven o'clock in the morning the sun began to shine; and the sky became clear. At this time he had reached a place, just below the Upper-narrows; seven miles from the fort. Here it was necessary for him to cross the river. At a small distance he perceived a salmon net stretched from a point, thickly covered with bushes, and a canoe lying on the shore. He therefore determined, after having cut a stout club, to lie by in the thicket, in order to rest himself, dry his clothes, and discover the persons who should come to take fish from the net; that he might decide on the safety, or danger, of making himself known. In this situ-

ation, he had spent near an hour, and made considerable progress in drying his clothes; not, however, without frequently looking down the river to see whether his enemies were pursuing him; when to his unspeakable joy he saw his friend *Burton* advancing towards him in the track, which he had himself taken. The meeting was mutually rapturous; and the more so, as each believed the other to have been lost.

Major *Burton*, after having passed through the hole in the ceiling, made his way directly into the second entry without interruption. As he had been able to escape from the ceiling, only by the assistance of General *Wadsworth*, he concluded, early, that his friend would be unable to make his way through the same passage, and, rationally determining it to be better, that one should regain his liberty than that both should be confined in a British jail, made no stop, to learn what had become of his companion. Passing out of the Eastern door, (the same which General *Wadsworth* had selected,) he entered the area of the fort, taking the most watchful care to avoid the sentry-boxes. The night was so intensely dark, that this was a matter of no small difficulty. Fortunately, however, he avoided them all; and steered his course, providentially, to the North-Eastern curtain. At the moment of his arrival the door of the guard-house was thrown open, and the relief ordered to turn out. *Burton* heard the orders indistinctly; and supposed, that himself, or General *Wadsworth*, (if he had been able to make his way out of the barrack,) was discovered. He leaped therefore from the wall; and fell into the arms of a *Chevaux-de-frise*, containing only *four* sets of pickets. Had there been *six*, as is sometimes the case, he must have fallen upon the points of some of them, and been killed outright. Perceiving that he was not injured by the fall, he flung himself into the ditch; and, passing through the abattis, escaped into the open ground. As he had no doubt, that either himself or General *Wadsworth* was discovered, and knew that, in either case, he should be closely pursued, he used the utmost expedition.

It had been agreed by the prisoners, that, if they should get out of the fort, and in this enterprise should be separated from each other, they should direct their course by the wind. Unfortunately, the gale, which in the afternoon and early part of the evening, had blown from the South, shifted, without being observed by Burton, to the East. Of the region round about him, except so far as General Wadsworth had described it to him, he was absolutely ignorant. In these unfortunate circumstances, instead of taking the direction, which he had intended, he pointed his course towards a piquet guard, kept near the isthmus; and came almost upon a centinel, before he discovered his danger. Happily, however, he perceived a man at a small distance in motion; and dropped softly upon the ground.\* The movements of the man soon convinced Burton, that he was a centinel, *and that he belonged to the piquet.* By various means the two friends had made themselves acquainted with the whole routine of the duty, performed by the garrison. Burton, therefore, from these circumstances discerned in a moment where he was, and determined to avail himself of the discovery. Accordingly, whenever the centinel moved from him, he softly withdrew; and at length got clear of his disagreeable neighbour. He then entered the water on the side of the isthmus next to the river, with the hope of being able to advance in it so far above the picket, as to land again undiscovered. The undertaking proved very hazardous, as well as very difficult. It was the time of low water. The rocks were numerous in his course; and the river between them was deep. A great quantity of sea-weed also encumbered his progress. He swam, and climbed, and waded, alternately, for the space of an hour; and having made in this manner a circuit, which, though small, he thought would be sufficient to avoid the guard, betook himself to the shore. Here, chilled with this long continued cold bathing, and excessively wearied by exertion, he began his course through the forest; directing himself, as well as he could, towards the path, which had been taken by General Wadsworth. After

\* Major Burton dropped a glove in this spot; which, being found in the morning, discovered, thus far, the course which he had pursued in making his escape.

walking several miles through the same obstructions, which had so much embarrassed his friend, he reached it, and without any further trouble rejoined the General.

After their mutual congratulations, the two friends, as they saw no persons appear, went down to the canoe ; and, finding in it a suit of oars, pushed it into the water. Burton informed General Wadsworth, that a party of the enemy was in pursuit of them, and that their barge would soon come round the point below ; and therefore proposed, that, instead of crossing the river directly, they should take an oblique course, by which they might avoid being discovered. Not long after the barge came in sight, moving moderately up the river, and distant from them about a mile. At this time the canoe was near half a mile from the Eastern shore ; but, being hidden by some bushes on another point, escaped the eyes of their pursuers. Just at the moment the crew of the barge, having rested for a minute on their oars, tacked, and rowed to the Eastern shore : when one of the men went up to a house, standing on the bank. The two friends, seeing this, plied their oars to the utmost ; and, when the barge put off again, had it in their power to reach the Western shore without any possible obstruction.

As they approached a landing place, they saw a number of people. To avoid an interview with these strangers, they changed their course ; and landed on the North side of a creek, where they were entirely out of their reach, and safe from their suspicion.

After they had made fast the canoe, they steered their course directly into the wilderness ; leaving the barge advancing up the river, but appearing to have made no discovery. The prospect of a final escape was now very hopeful : but, as there could be no safety in keeping the rout along the shore, since they undoubtedly would be way-laid in many places, they determined to take a direct course through the forests, to avoid inhabitants, and prevent a pursuit. Accordingly, they steered towards the head of St. George's river. This they were enabled to do by the aid of a pocket compass, which Burton had fortunately retained in his

possession. Their pockets supplied them with provisions; homely enough indeed, but such as satisfied hunger, and such as success rendered delightful. Two showers fell upon them in the course of the day: and the heat of the sun was at times intense. Their passage, also, was often incommoded by the usual obstructions of an American forest; fallen trees, marshy grounds, and other inconveniences of the like nature. But, with all these difficulties, they travelled twenty-five miles by sunset.

At the approach of night, they made a fire with the aid of a flint, which Major Burton had in his pocket, and some punk; a substance, formed by a partial decomposition of the heart of the maple tree; which easily catches, and long retains, even the slightest spark. But, as they had no axe, and as they did not commence this business sufficiently early, the wood, of which their fire was made, being of a bad quality, burnt ill; and was extinguished long before the morning arrived. The night was cold, notwithstanding the heat of the preceding day. Both extremes were equally injurious to the travellers; and increased not a little the lameness, and soreness, of their limbs. General Wadsworth suffered severely. He had been a long time in confinement; and had of course been prevented from taking any vigorous exercise. He was also possessed of a constitution, much less firm than that of his companion; and was much less accustomed to the hardships of travelling in a forest. For these reasons they made a slow progress, during the morning of the second day. By degrees, however, the General began to recover strength: and before evening they advanced, though not without much difficulty, twelve or fifteen miles. The sufferings of the preceding night effectually warned them to begin the employment of collecting fuel in better season. They had, therefore, a comfortable fire. Still, the latter part of the night was very cold and distressing.

On the third day General Wadsworth was so lame, and had suffered so much from this uncomfortable pilgrimage, that he was able to make very little progress. After many efforts, he proposed to stop in the wilderness, and wait for such relief, as his friend, proceeding onward to the nearest settlements, might be

able to bring him. Major Burton cut the matter short by an absolute refusal to leave him behind, in circumstances so hazardous. At length they determined to refresh themselves with a little sleep, and then to recommence their progress. This determination was a happy one; for they found their sleep, in the genial warmth of the day, in a high degree restorative, and invigorating. They were able to travel with more and more ease; and were not a little animated with the consciousness, that their pilgrimage was drawing towards a close. About six, P. M. they discovered from an eminence the ascent of a smoke, and other signs of human habitations; and soon, to their unspeakable joy, arrived at the place, to which they had originally directed their course: the Upper Settlements on the river St. George.

The inhabitants flocked about them with a joy, scarcely inferior to theirs; and not only hailed them as friends long lost, but as men dropped from the clouds. Their surprise, and their affection, were equally intense: and their minds laboured for modes, in which they might exhibit sufficient kindness to their guests.

At this friendly place they took horses; and, accompanied by all the inhabitants, who were able to bear arms, proceeded down the river, within three miles of the house, in which General Wadsworth had been taken prisoner. Here they crossed the river; and took up their lodging on the other side in a very comfortable inn. Their company had by this time increased to thirty men. Half of this force General Wadsworth gave to his faithful friend; who was then distant only three miles from his own house; a stone fort, anciently erected as a defence against the savages. It was naturally suspected by both gentlemen, that concealed parties of the enemy would lie in wait for them; and, if possible, carry them back again to their prison. Nor was the suspicion unfounded. Such a party actually waylaid Major Burton upon his return to his family: and, had he not been accompanied by this body of armed men, he would again have been taken. Finding themselves frustrated, the lurking party seized a trading vessel, lying in St. George's river; and returning to Bag-

aduce, carried the first information to the fort concerning the prisoners.

As to General Wadsworth, he was now in a settlement, where he could not be attacked with any hope of success, unless by a strong detachment of the enemy. He therefore continued at this hospitable inn, until the next day but one. Then, having recovered one of his horses, and renewed his strength and spirits, he set out for Falmouth, (Portland;) where he hoped to find Mrs. Wadsworth. During the first day's journey he was accompanied by a small guard. From this time he was safe from the lurking parties of the enemy; and proceeded to Falmouth as his own convenience permitted.

Mrs. Wadsworth and Miss Fenno had, however, sailed for Boston before his arrival. On their passage they were overtaken by a violent storm; and barely escaped shipwreck. The vessel put into Portsmouth in distress; and neither of the ladies was acquainted with a single inhabitant. They took lodgings, therefore, at an inn. When they had in some measure recovered themselves from the anxiety and distress, produced by the perilous situation, from which they had just escaped, they found themselves in a new scene of trouble. Mrs. Wadsworth had left all the specie in her possession with the General, when she visited him at Penobscot: and, during her residence in the District of Maine, the Continental bills of credit had lost their currency. She was, therefore, without money, and without any known friends. After meditating for some time on various expedients to extricate herself, and her friend, from this embarrassment, not a little perplexing to a female mind, she recollected, that she had seen at New-Haven in the year 1770 Mr. Buckminster, then a tutor in Yale College, and now one of the ministers of Portsmouth.

From this gentleman the ladies, after having made him acquainted with their circumstances, received every assistance, which they could wish. When they were ready to proceed on their journey, he furnished a carriage, to convey them to Newburyport. Here they met with the same friendly offices, and were supplied with the means of proceeding pleasantly to Boston;

where the distresses of both Mrs. Wadsworth, and the General, were speedily terminated by his arrival.

I shall only add, that I received an account of all these facts from the persons principally concerned ; and am, Sir,

Yours, &c.

## LETTER XX.

Vernon—Tolland—Stafford—Mineral Spring—South-Brimfield—Kittery—York—  
Wells—Kennebunk—Portland.

*Dear Sir,*

IN the year 1807, I set out September 15th, on a third journey to the District of Maine, in company with two alumni of Yale College. We reached Hartford the first day; and the day following, passing through East-Hartford, Vernon, Tolland, Stafford, and South-Brimfield, arrived at Brimfield in the evening, thirty-six miles. On the 17th we entered the great Western road of Massachusetts at Brookfield; and that night reached Worcester, twenty-eight miles. The next day, taking the same road, which I took in my first journey, we proceeded to Concord: thirty-two miles: and the next day, to Andover: twenty-one. Here we continued until the Tuesday following. We then rode to Exeter; and the next day (September 23d) passed through Portsmouth to York. During this part of the journey I made the following observations.

The country between New-Haven and Vernon had been generally, and regularly, improved in its appearance.

Vernon, twelve miles North-East from Hartford, is a township, lying partly on the Western side, and summits, of the Lyme range, and partly on the marginal slope, and plain, below. The former of these divisions is good grazing land. The latter has a warm, kind soil, well suited to grain. The acclivity of the hills is finely prospective. The inhabitants are farmers, in comfortable and thriving circumstances. Their Church is without a steeple.

Vernon was originally a part of Bolton; and in 1810 contained 827 inhabitants.

A cotton manufactory, for a long time the only successful one,\* established in Connecticut, has been set up here by an Englishman, named Warburton. As he began this business with bor-

\* 1807.

rowed stock, and is now the sole proprietor of the manufactory, the mill-seat on which it stands, and a valuable house, together with several other buildings in the vicinity; he must, I think, have pursued it with advantage. The cotton spun here, I am informed, is sold chiefly in yarn.

Tolland is a pretty town, situated in an open valley on the Lyme range. The soil is good; and particularly friendly to grass. The town is chiefly built on a single street, running East and West, sufficiently level, and containing about fifty well-appearing houses; a Church, Court-house, and Gaol.

The inhabitants of Tolland have been distracted by political, and religious, divisions.

The number of inhabitants in this township was, in 1756, 917; of whom 15 were blacks: in 1774, 1,262: blacks 15: in 1790, 1,538: in 1800, 1,638: blacks 25: slaves 3; in 1810, 1,610, and no slaves.

Stafford lies North-Eastward of Tolland, on the same hills. The soil is hard, and indifferent; the surface rough, and sometimes romantic; and the houses, taken together, moderately good. It contains two parishes. In the Eastern parish there is a loosely built village upon a street, running North and South over very elevated ground. The Church is without a steeple.\* The principal part of this township, and of Tolland also, is distributed into farms.

On the bank of Willimantic river, a romantic millstream, which is one of the head waters of the Shetucket, and runs through this township, is a mineral spring, long since celebrated for its medicinal virtues. These waters are impregnated with iron, held in solution by carbonic acid gas. They are remarkably distinguished for curing the salt rheum. They have also produced the best effects on contracted joints, and enervated muscles. The resort to them, formerly great, was for many years interrupted for want of convenient accommodations. It has again become considerable within a very few years, in consequence of the commendable exertions of Doctor Willard.

\* Since this was written, another church has been built.—*Pub.*

Stafford abounds in iron ore ; and contains two furnaces, principally employed in casting hollow ware. A small volcanic explosion took place a few years since, in one of the hills, belonging to this range, about three miles West of the Spring.

The inhabitants of this township, also, have been divided by religious and political contentions ; and, like those of Tolland, have very little cause to congratulate themselves on the moral influence of these divisions.

In the year 1756, Stafford contained 1,000 inhabitants : no blacks : in 1774, 1,334 : 1 black : in 1790, 1,885 : in 1800, 2,345 : 14 blacks : no slaves : in 1810, 2,235. The Church in the East-ern parish has no steeple.

South Brimfield lies immediately North of Stafford on the same range of hills ; and is the Southernmost township in the County of Hampshire, in this quarter. Its soil, surface, and other characteristics, are nearly the same with those of most other towns in this neighbourhood. We had a romantic view of the Church which is a neat building, surrounded by a hamlet of decent houses, rising beyond the waters of a beautiful lake, seen in the half faded lustre of a charming evening. This township was incorporated in 1762 ; and contained, in 1790, 98 dwelling-houses, and 606 inhabitants ; in 1800, 774 inhabitants ; and, in 1810, 645.

Brimfield I shall describe hereafter. From Brookfield onward we found the country generally improved ; particularly Worcester, and Plaistow. The latter of these townships had become a very pleasant collection of farms, strongly indicating the prosperity of the proprietors.

At Tewksbury we saw a field of hops, which the owner and his family were gathering. By him we were informed, that the best lands in this township yield from one thousand, to fifteen hundred pounds an acre ; and that they had been sold, during the present autumn, for six pence a pound. An acre yields, therefore, from \$83 34, to \$125.

At Exeter, on a visit to Judge P. we ate fine grapes. He informed us, that they grew here luxuriantly. This is the most Northern situation, in which I have known foreign grapes cultiva-

ted with success ; although I have not a doubt, that, with suitable care, they would flourish in the District of Maine. Peaches fail here ; principally from shooting out their buds too early, and thus exposing them to succeeding frosts. The same misfortune befel peaches at New-Haven in the year 1806. A course of warm weather in February protruded the buds so far, that the frosts of the two following months, which were very severe, destroyed them ; and they fell to the ground without blossoming. A heap of snow raised around the tree in the proper season might, perhaps, prevent this too early vegetation.

From Portsmouth we crossed the Pascataqua to Kittery, one of the most ancient townships in the District of Maine, bounded by this river on the South-West, and the ocean on the East ; and incorporated in 1653. The soil is indifferently good ; and the surface not unpleasant. It is wholly distributed into plantations ; and contains three parishes, three Congregations, and a society of Friends. The number of inhabitants in this township was, in 1790, 3,250 ; in 1800, 3,114 ; and, in 1810, 2,019.\*

York borders upon Kittery, and on the ocean ; and is one of the most ancient settlements in New-England having been begun in 1630. Its original name was *Agamenticus*, from the mountain so often mentioned in these letters. Afterwards it was called *Gorgiana* by Sir Ferdinando Gorges ; who intended to make it the seat of his government. Accordingly he made it a Corporation, resembling an English borough, and under the government of a Mayor, eight Aldermen, and a Recorder. It received the name of York in 1652 ; when the Colony of Massachusetts Bay assumed the jurisdiction of Maine. The face of this township, and the manner of settlement, wear a general resemblance of Kittery. The Northern part of it, however, is so covered with rocks and stones, as to be of little use for any thing, beside the production of wood. It is no small misfortune to the inhabitants ; that thousands of acres, which are now bare, and yield a stinted subsistence to their cattle, were not left in their forested state. The Southern division has a better aspect ; yet even this appears

\* Elliot.

naked, and bleak. The forests are not only cut down; but there appears little reason to hope, that they will ever grow again. In the mind of an American, frequent forests, and frequent as well as fine groves, are almost necessarily associated with all his ideas of fertility, warmth, agricultural prosperity, and beauty of landscape. Nor can he easily believe, that a country, destitute of trees, is not destitute of fertility. The cultivated part of this township seems not to be unproductive. Yet from the extensive nakedness, which meets the eye, it is difficult for the imagination not to pronounce it barren.

The town of York wears a strong appearance of stillness, and solitude. The houses, with a few exceptions, together with the out buildings, and fences, have in a peculiar degree, an air of antiquity; and look, as if they had met with but few changes for a long period. From the aspect of every thing around him a traveller would expect to find, here, the sober manners, brought with them by the first settlers of New-England; and, I suspect, would not be disappointed.

Over York river, which is principally an arm of the sea in the Southern part of this township, is a bridge, two hundred and seventy feet in length, excluding the abutments. It stands upon thirteen piers of wood: each containing four posts, driven into the earth. This bridge was contrived by Major Samuel Sewall of this town, formerly mentioned in these letters; and was the first structure of the kind, erected in the American States.

The township of York is esteemed healthy. By an estimate of more than thirty years, one, in six or seven of all who have died, has passed seventy years of age; and several have reached the borders of one hundred years. In the first parish, two ministers occupied the desk one hundred and six years. The Rev. Samuel Moody began his ministry in 1700, and finished it, together with his life, in 1748. The Rev. Isaac Lyman, who succeeded him in 1749, was living in 1806.

There is a spot in this township, which, from the following fact, is called the Devil's Invention. An inhabitant offended with one of his neighbours determined to revenge himself by starving two

of his children ; boys between six and nine years of age. To accomplish this design, he built a small enclosure of logs at the side of a precipice. The logs above juttred over those below ; so as to make it impossible to escape by climbing. When the work was finished, he persuaded the children to go out with him, to hunt birdsnests. Having led them to this spot, he forced them into the enclosure, and left them to their fate. Necessity can sharpen the wits even of children. The little fellows, finding no egress at the top, began to look for one at the bottom ; and, under the direction of mere nature, scratched a passage beneath the logs, through which they escaped. As they knew not the way to the town, they wandered three days about the fields, and forests ; and were, at length, led by the noise of the ocean to the shore. Here they were found alive by some of the inhabitants, most of whom had, during this time, been employed in a diligent search for the unfortunate sufferers. This event took place in 1676. As Philip's war was raging at the time ; it is not improbable, that the mischief was contrived with an expectation, that the disaster would be attributed to savage incursion ; and cease so soon to be an object of public attention, that no effectual attempts would be made to find them.

The villain, who formed, and supposed that he had done every thing to execute, this diabolical purpose, was sentenced to receive thirty stripes, "well laid on;" to pay the father five pounds, and the Treasurer of the County ten; to pay the charges of imprisonment ; and to remain a close prisoner during the pleasure of the Court. Few inventions have, I think, been more worthy of the Devil, than this.

York in ancient times was frequently invaded by the Savages. On the fifth of February, 1692, a body of these people, headed by a number of Frenchmen, entered the town upon snow-shoes, early on Monday morning ; burnt all the houses North of York river, except four, which were garrisoned ; killed about seventy-five persons ; and carried as many more into captivity. Among the slain was the Rev. Shubael Dummer, their minister. By this disaster the town was almost entirely ruined ; and came very ear being finally deserted.

York is the shire-town of the County, which bears its name. It contains a Court House, and a Gaol. In 1764, the number of inhabitants was 2,298 ; in 1790, 2,900 ; in 1800, 2,776 ; and, in 1810, 3,046.

Before the American Revolution the people of York employed from twenty to thirty vessels in the West Indian trade, and other business: but, their vessels being either lost or destroyed, the trade has never revived to its former extent. The cod-fishery might be carried on here with advantage; but is not, from the want either of property, or enterprize.

The Rev. Mr. Moody, formerly minister of this town, was eminently distinguished for his piety, and usefulness as a minister; and scarcely less for those peculiar traits which constitute originality of character.

September 24, we passed through Wells, and Kennebunk to Saco. Wells is an extensive township, lying immediately North of York. It was originally named Webhannet. It spreads ten miles along the coast, and seven into the interior. Its surface, towards the Southern boundary, resembles the Northern parts of York; but the Northern and Western parts are a yellow-pine plain, sandy and unproductive. One third of the township, only, is considered as fit for agricultural purposes. The aspect of Wells is much less pleasant than that of York: a great part of it being a continued plain; with very little variety, except what is furnished in a few instances by the appearance of the ocean. The houses are built in a scattered manner on the road, throughout the whole extent of the first parish; with only the exception of a small, decent village toward the Northern limit, in which, I presume, some commercial business is carried on. The same solitary feelings, the same silence, the same sense of being sequestered from mankind, accompanied us until we arrived at Kennebunk; and they were not lessened by the magnificent view, now and then presented by the illimitable ocean on the East.

This township was granted in the year 1643; and incorporated in 1653. It has often been distressed by the savages. In the

year 1692, it was invaded by an army of three or four hundred French and Indians, under the command of Labroczee, a Frenchman, and Madockewando, a noted Savage warrior. The assault lasted two days: but the enemy was finally driven off by the gallantry of the inhabitants; and thus the town escaped from entire destruction. Wells contained, in 1790, 3,070 inhabitants; in 1800, 3,692; and, in 1810, 4,489.

Kennebunk is the second parish of Wells. We found this settlement materially improved in its buildings, and in its business.

The commerce of York and Kennebunk may be estimated in some measure by the following table of duties:—

Years.		Kennebunk.			York.
1801	- -	\$44,217	- -		\$11,303
1802	- -	46,188	- -		8,960
1803	- -	40,969	- -		15,710
1804	- -	33,962	- -		17,504
1805	- -	53,550	- -		16,840
1806	- -	81,273	- -		10,926
1807	- -	52,642	- -		25,877
1808	- -	34,667	- -		16,498
1809	- -	29,501	- -		17,113
1810	- -	20,820	- -		44,141

The country between Kennebunk and Portland I shall describe hereafter.

No place, in our route, hitherto, could for its improvements be compared with Portland. We found the buildings extended quite to the cove, doubled in their number and still more increased in their appearance. Few towns in New-England are equally beautiful and brilliant. Its wealth, and business, are probably quadrupled. Its commerce with the interior of New-Hampshire and Vermont particularly the Northern parts of these States, had greatly increased; and will in all probability continue to increase. The produce of these tracts is conveyed to market chiefly in sleighs. Very frequently the snow fails, for a considerable distance before they reach Boston: where as in most cases it extends quite to Portland. This fact will, of itself, go far towards secur-

ing to Portland the commerce in question. At the same time, it is so far advanced beyond the other settlements in Maine, that it will probably continue to command, at least, the commerce of this District for a long period.

Portland\* contains three Presbyterian, one Episcopal, one Baptist and one Methodist, Congregations. Such a collection of inhabitants, gathered by business, and by accident, from many quarters, must be supposed to bring with them a corresponding mixture of principles; and, in many instances, may easily be believed scarcely to have formed any principles at all. Persons of the latter description seat themselves on commercial ground, to amass property; not to find the way to heaven; and of such persons will no small part of such an aggregation ordinarily consist. To such an unfortunate, moral state of society is sometimes happily opposed that peculiar influence in favour of religion, which is exerted, too rarely I confess, by superiour talents, united with superiour piety. On such efforts heaven has heretofore smiled with distinguished benignity. Were they happily to be made here, they could, I think, hardly fail of success.

A number of gentlemen in this town have erected an observatory on the Eastern part of the peninsula. It is the frustum of an octagonal pyramid; and is ascended by successive flights of stairs; the last of them spiral. The design of erecting this structure is to descry vessels, off at sea. It is the only work of the kind, so far as my knowledge extends, in the United States. From this elevation there is a noble prospect of the interior, particularly of Mount Washington; rising at the distance of seventy miles, far above all the other mountains in prospect with a sublimity, which mocks description.

I am, Sir, yours, &c.

\* 1807.

## LETTER XXI.

Falmouth—North-Yarmouth—Freeport—Brunswick—Bowdoin College.

*Dear Sir,*

WE left Portland on the 25th, after dinner; and passed through a part of Falmouth, and North-Yarmouth, to Freeport; having travelled this day, from Saco, thirty miles. The road from Portland, Eastward, crosses the cove. Since my former journey to this town a new toll-bridge has been built over this basin; and another near the mouth of the river Stroudwater; which, beside shortening the distance, conducts all the travelling on the great Eastern road through Portland. The difference of the distance I should judge to be about four miles.

The part of Falmouth, which lies East of Portland, exhibits nothing to gratify the eye of a traveller. The houses are generally indifferent; the surface undulating indeed, but rugged and forbidding, without any of that beautiful conformation, naturally looked for among hills and vallies; the soil cold, and lean; and the cultivation such, as seems unlikely to render it more fertile. Both the spruce, and the fir, abound here; but are destitute of that thrifty appearance, which render them so handsome in the neighbourhood of Lancaster. Here, however, I first took a particular notice of a silver light, diffused over the leaves of this tree; peculiarly visible, when it is seen in a point, opposite the sun; and covering it universally with a very delicate and most beautiful lustre. This, I presume, is the silver fir. I know of no other tree, which can boast of a brilliancy, comparable to this. Here also we found the juniper, in considerable numbers. The utmost height, to which this shrub rises from the surface, is commonly not more, and often less, than eighteen inches. But the shoots which spring up together from one root, are innumerable; and spread in a close compacted mass, like the flower of the thistle, over a spot of ground from three to ten feet in diameter. This shrub is extremely injurious to the farm, and is eradicated with great difficulty.

North-Yarmouth is a handsome farming township. The surface is a succession of easy slopes ; the soil good ; and the people are plainly in pleasant circumstances. The township is large ; and every where exhibits this pleasing aspect. About twelve miles from Portland, and not far, I believe, from the centre of the township, a pretty village, surrounding a neat church, crowns the summit of a very handsome rise, about half a mile North of the road. The rest of the township is chiefly filled up with scattered plantations.

North-Yarmouth contains three Presbyterian, and one Baptist, Congregations ; and was incorporated in 1713. In 1790, the number of inhabitants was 1,970 ; in 1800, 2,599 ; and, in 1810, 3,295.

Freeport lies immediately East of North-Yarmouth. It is every way less handsome. The ground is much more rough, and apparently less fertile. The inhabitants, however, appear to be thrifty ; and have in many instances built themselves good houses. A lead mine is said to have been found here. In both these townships, particularly in North-Yarmouth, the pastures, and meadows, were covered with lively verdure, and the meadows, frequently, with a good crop of grass. The crops of maize, also, allowing for the coldness of the summer, were good ; and the potatoes were generally so throughout the District. Flourishing orchards were numerous : and most of the cattle, and sheep, were in good flesh, and of a good size. The horses, which we saw, were rather small ; but appeared to be strong, and hardy.

Freeport was incorporated in 1789 ; and includes one Presbyterian Congregation. It contained, in 1790, 1,330 inhabitants ; in 1800, 2,230 ; and, in 1810, 2,184.

Brunswick lies North-Eastward from Freeport, and South-Westward of the Androscoggin, and of Merrymeeting Bay, formed by the junction of that river with the Kennebeck. A considerable part of this township is a yellow-pine plain ; the soil thin and light, but, like other plains of the same kind, warm, and, when well cultivated, productive. A considerable village is built

upon the plain; chiefly on a single street, running Southward from the falls of the Androscoggin about a mile.

Towards the Southern extremity of this township stands Bowdoin College: an Institution, incorporated in 1794, and deriving its name from the Hon. James Bowdoin, late Governour of Massachusetts Bay. The present Hon. James Bowdoin, his son, gave, towards the erection of a College in Maine, \$10,000 in money and lands. The State of Massachusetts has also given to it six townships in this District. Its funds have been well managed; and are already considerable. Its buildings are two Colleges, a Chapel, and a Presidential house. One of the Colleges is fifty feet in length, forty in breadth, and three stories high; containing twelve rooms. The other, one hundred feet in length, forty in breadth, and four stories high; containing thirty-two rooms. This building is unfinished;\* and will probably be completed the ensuing summer. Both Colleges are good structures of brick. The chapel is small, but sufficiently large for the present state of the institution. It has two stories; the first of which contains the chapel, properly so called; the second the library, the philosophical apparatus, and a museum. The library consists of about fifteen hundred well chosen volumes, well arranged. The apparatus is a valuable collection of the most useful instruments.

This institution, like the University at Cambridge, is encumbered with two legislative bodies; a board of Trustees; and a board of Overseers: the former having power to originate, the latter to negative, academical measures. This unfortunate complication of government renders its whole state uncertain, prolix, and indecisive; furnishes room for the operation of multiplied personal interests, prejudices, intrigues, and unfortunate compromises; and, generally, prevents the order, energy, and decision, attendant upon a single board. A body of Overseers, occasionally called together to meddle with the affairs of a College, will usually feel so little interest in them, except at the moment, as never to be in possession of the system, intended to be pursued;

\* 1807.

the wisdom, and expediency, of one part of which will often depend more on its relation to the other parts, than on its own nature. Often they will not come together, at all, in such numbers as to form a quorum; and will thus prevent the accomplishment of the business, for which they were summoned. The very numbers, of which they consist, will of course include many; who are incompetent judges of academical concerns; and many more, who will never take pains to inquire into their nature, or to possess themselves of that judgment, which their capacity would in better circumstances enable them to form. Their decisions, therefore, will often be sudden; often crude, and not unfrequently hostile to the very interests, which they would wish to promote. To secure the prosperity of such an institution, it is indispensably necessary, that a system, embracing all its interests for a considerable period at least, should be carefully formed, and closely pursued. All, who are to vote, should distinctly understand this system; and, whenever they come to act, should have it fully in their minds; so as to comprehend readily the relation, which every new measure has to the general scheme, and its proper influence on measures already adopted. This can be done, only by a long continued, and minute acquaintance with the affairs of the institution; and can never be done by men, who, occupied busily in totally different concerns, come rarely and casually, to the consideration of these. The votes of such men will be governed by the impulse of the moment; by whim; by prejudice; by attachment to a friend, or a party; and sometimes, not improbably, by the mere fact, that their duty requires them to vote: when, perhaps, they are wholly at a loss whether the vote, actually given, will be useful, or mischievous. If such a system be not so pursued; the interests of a public seminary can never become prosperous, unless by accident, or by the peculiarly meritorious labours of a wise and vigorous Faculty; overcoming many disadvantages, and preventing with uncommon prudence, and felicity, the mischievous effects of indigested, desultory regulations.

The houses in Brunswick are moderately good. The plain, on which they are principally built, though not fruitful, is well fitted

for the purposes of building, and gardening. A firm sand may usually be rendered fertile, to any degree, by cultivation ; and always furnishes the privilege of walking, without the incumbrance of mud. Gardens, also, are always earlier on such ground, than on a more tenacious soil.

The commerce of Brunswick is connected with Kennebeck river by means of the Androscoggin. The latter of these rivers is crossed between Brunswick and Topsham on a toll bridge ; two miles below which its waters are navigable for small vessels to the Kennebeck. Southward, Brunswick is bounded on Maquoit bay. Both of these waters are too shoal to admit of any considerable navigation.

There are three churches in Brunswick : one of them lately erected near the College for the accommodation of the officers and students, and the inhabitants of the village. The village may contain perhaps fifty houses.

Brunswick was incorporated in the year 1738 ; and, together with all the townships along this coast, suffered in the earlier stages of its settlement, from the depredations of the Savages. In 1790, Brunswick contained 1,387 inhabitants ; in 1800, 1,809 ; and, in 1810, 2,682.

I am, Sir, yours, &c.

## LETTER XXII.

Bath—Woolwich—Dresden—Pittston—Gardiner—Augusta—Hallowell—Litchfield  
Topsham—the Americocoggin—the Kennebeck.

*Dear Sir,*

THE road from Brunswick to Bath, hitherto customarily used, is in the main a good one; passing about three miles over the plain already mentioned, and seven more over an undulating ground. A new one is nearly finished in the turnpike manner, which cuts off three miles.

Bath is a flourishing town on the Western side of the Kennebeck; fifteen miles from the mouth of that river. It extends a mile and a half in length, along the river; and three quarters of a mile in breadth, into the interior. The township is near six miles in length, and three in breadth; and contains probably between two hundred and two hundred and fifty houses. It includes two Congregations, who assemble in two churches; one of them handsome. The houses are generally neat; and some of them superiour to this description. The streets run parallel to each other and at right-angles with the river. The town is built on a fertile declivity; rather steep, and interrupted by irregularities of surface. The prospect from the churches, which stand on the higher parts of the acclivity, is cheerful; particularly that of the town itself. Bath carries on a considerable commerce, and wears the aspect of thrift. The Kennebeck is navigable up to Bath for ships of war, carrying forty or fifty guns. But the access for such large vessels is said to be dangerous, unless they are conducted by a skilful pilot.

There is an Academy, established here for the education of boys, and another for girls. A greater number of sober, religious people are found in this, than in most other settlements, in similar circumstances. In 1790, Bath contained 947 inhabitants; in 1800, 1,225; and, in 1810, 2,491. The Kennebeck is here a mile in breadth.

We continued at Bath until Monday morning, September 28th ; when, crossing the ferry to Woolwich, we rode through Dresden, and a part of Pittston ; and, crossing the river again, through a part of Gardiner, and through Hallowell, to Augusta. Thence, after taking a view of this town, we returned to Hallowell.

Bath ferry is a mile and a half above the town, where the river is three quarters of a mile in breadth. We crossed it safely in a boat of a moderate size ; but not without anxiety. The country, from the ferry to Dresden, along the Eastern bank of the Kennebeck, is universally undulating : the hills of no great height, or extent ; and without any remarkable beauty, or fertility : the surface, extremely encumbered with rocks and stones ; few of them however large : the soil, loam, abounding in gravel : the forest composed chiefly of oaks and pines : the settlements few, scattered, and unpromising : and the road difficult and discouraging ; chiefly because it has been very little wrought. The river, with its shores and islands, forms almost the only collection of objects in view, along this road. The river itself is beautiful ; and is from half a mile to two miles in breadth, in different places. Its shores, except that they are frequently indented by the winding course of the stream, present little variety ; being almost everywhere sudden acclivities, and generally covered with forest. The islands are also forested ; but are cheerful objects.

Of Woolwich I know nothing, except that it was incorporated in 1759, and contained, in 1790, 797 inhabitants ; in 1800, 868 ; and, in 1810, 1,050.

Dresden lies along the river. The surface to a considerable extent is smooth ; and the soil tolerably good. A moderately well built village stands on the road ; over against which we saw two or three small intervals : the more agreeably as being here very unusual.

Dresden was incorporated in 1794. In 1800 it contained 700 inhabitants ; and, in 1810, 1,096.

From Dresden we entered Pittston : our journey still continuing through a country, at times agreeable ; particularly about seven miles above the village of Dresden. Here we left the road in a

well appearing settlement, and crossed the river again at Smith's ferry. The river at this place is about half a mile wide. We landed a little below a village, commonly called Cobbesconte; originally named by the Indians Cobbisconteag; and known among the neighbouring inhabitants by the abridged name of Cobbisse. This village wears a smart, sprightly appearance. The name of the village is derived from a mill stream, issuing from a small lake, (having the same appellation,) in the township of Winthrop. Pittston originally lay on both sides of the river: but that part of it which is on the Western side, was incorporated in 1803 by the name of Gardiner. The whole township contained, in 1790, 605 inhabitants. Gardiner contains an Episcopal church; and is possessed of a fund, yielding twenty-eight guineas per annum, for the support of an Episcopal clergyman; given by Dr. Gardiner, from whom the township was named. The surface, near the river, is generally smoother, and the road better, than most of that, which we had left. There is, however, throughout most of this region, one very disagreeable inequality in the surface. The smaller rivers, and brooks, flowing generally on ground, considerably elevated above the level of the large rivers, and the ocean, have worn in the neighbourhood of both, ravines; which, being chiefly formed in clay, (the substratum of almost all this country,) are sudden, deep, and bordered by long and tedious acclivities. In wet seasons, the clay becomes extremely slippery: and, unless a horse is corked, is dangerous both to him and the rider. As these ravines are very frequent, they render travelling exceedingly wearisome.

Augusta was the termination of our journey in this quarter. This is the shire town of Kennebeck County. It was formerly a part of Hallowell: and was incorporated in the year 1797. It contains a neat Presbyterian church; an academy; a courthouse, and a goal; together with a considerable collection of good dwelling houses. These are built partly on a beautiful plain; in this country no very common object in the landscape; and partly on a declivity, descending from this plain to the river, The declivity, like most of those along the Kenne-

beck, is rather steep. The plain is a neat and smooth ground ; and is elevated one hundred and fifty or two hundred feet above the surface of the river. The prospect around this town, and indeed its whole aspect, is handsome, and very cheerful. Like Hallowell, the township lies on both sides of the river : the two parts being connected by a wooden bridge, well built on a succession of arches. Such a work in a country so recently settled is a very respectable proof of the enterprise, and public spirit, of the inhabitants. Augusta is at the head of ship navigation on the Kennebeck. Brigs of one hundred and fifty tons are loaded here. It contained, in 1800, 1,211 inhabitants ; and, in 1810, 1805.

From Augusta we returned the same evening to Hallowell ; where we lodged. The road between these towns is very good.

Hallowell is a very pretty town, built on an irregular, or rather steep, descent. This slope, though interrupted, is handsome, and furnishes more good building spots, than if it had been an uniform declivity, and at the same time equally steep. Then all the grounds would have descended too rapidly. Now they furnish a succession of level surfaces for gardens, house-plats and court yards ; and are thus very convenient, as well as sometimes very handsome. The streets are both parallel, and right-angled to the river ; but, like those of all other towns throughout this country, are irregular. The houses, being generally new and decent, have the same cheerful appearance, which has been so often remarked. Several of them are handsome, and surrounded by very neat appendages. All the situations on the higher grounds are fine. A more romantic spot is not often found, than that on which stands the house of Mr. V. a descendant of Mr. Hallowell, from whom this town took its name ; inheriting from him, it is said, a large landed estate in this country. He is a native of England ; and has been heretofore a member of the British Parliament. His house stands on one of the elevated levels, mentioned above, where the hill bends from its general Southern direction toward the West, and, forming an obtuse, circular point, furnishes a beautiful Southern ; as well as Northern and Eastern, prospect. The river, here lying almost immediately below the eye, is a noble object.

In the rear, as you recede from the river, but at the side of the house, (the front being Southward, and looking down the river;) lies a handsome garden, furnishing even at this time of the year, ample proofs of the fertility of the soil. Behind the garden is a wild and solitary valley; at the bottom of which runs a small mill stream. Its bed is formed, universally, of rocks and stones. In three successive instances strata of rocks cross the stream obliquely; and present a face so nearly perpendicular, as to furnish in each instance, a charming cascade. These succeed each other at distances conveniently near; and yet so great, that one of them only can be seen at a time. The remaining course of the stream is an alternation of currents, and handsome basins. On either side, the banks, which are of considerable height, and sometimes steep, formed of rude forested grounds, and moss-grown rocks, are left absolutely in the state of nature. Along the brook Mr. V. has made a convenient foot-way, rather appearing to have been trodden out by the feet of wild animals, than to have been contrived by man, and winding over a succession of stone bridges, so rude and inartificial, as to seem the result of accident, rather than the effect of human labour. With these little exceptions, the whole scene is left, with the best taste, as it was found. A charming change from the cheerfulness of the house, garden and town, and the splendour of the river and its shores, is here experienced in a moment. The first step out of the rear of the garden is into wildness, solitude, and gloom. I know not so handsome an appendage of nature to any gentleman's seat in this country.

With this interesting family we spent the evening and the succeeding morning until 11 o'clock; and enjoyed in a high degree the combined pleasures of intelligence, politeness, and refinement. Mr. V. had proposed to carry us to a fine view of the country, furnished by a neighbouring eminence: but a mist, rising from the river during the night, precluded us from this gratification, until it became so late, that we were obliged to pursue our journey.

Mr. V. with a benevolence highly honourable to him, gives medical advice to the poor; and to patients, whose diseases are attended with peculiar danger; but always without any compensation. At the same time he never suffers his assistance to interfere either with the business, or the character, of the practising physicians of the neighbourhood.

There is an academy, already established in Hallowell, which was incorporated in 1791. Its funds are considerable; and its reputation good. There is one church, only, in this town: a good building.

Hallowell was incorporated in the year 1771. In the year 1790, the township, including Augusta, contained 1,194 inhabitants. In 1800 Hallowell contained 1,364, and Augusta 1,211: 2,575. The increase in ten years was 1,381. This township has, therefore, more than doubled its number of inhabitants, within that period. In 1810, Hallowell alone contained 2,068, and Augusta, 1805: 3,873.

The following abstract of duties on imports will show you, in some measure, the commerce of Bath, Hallowell, and Augusta: Bath being the common port of entry for these three towns.

Years.	Duties.	Years.	Duties.
1801	- - \$22,082	1806	- - \$ 38,356
1802	- - 31,141	1807	- - 31,117
1803	- - 27,194	1808	- - 3,779
1804	- - 36,103	1809	- - 25,813
1805	- - 35,044	1810	- - 13,466

Tuesday Sept. 29, we left our friends at Hallowell and rode to Brunswick; where we arrived soon after it became dark: twenty-nine miles. Wednesday we arrived at Portland between three and four o'clock. At ten the next morning we left Portland and rode to Kennebunk. The next day we passed through Berwick, Somersworth, and Dover; and arrived at Portsmouth, by Pascataqua bridge, at five. A violent storm from the North-East commenced this afternoon. The rain began to descend furiously about half an hour before we reached Portsmouth; and continued through the principal part of the two succeeding days.

The country, between Hallowell and Brunswick, is almost universally a succession of hills and vallies. The hills are of considerable height ; but slope so gradually, as to render the travelling not inconvenient. In this tract we passed, unless I mistook their limits, through the townships of Gardiner, Litchfield, Bowdoin, a corner of Bowdoinham, and Topsham. The principal differences in the appearance of this region are, in most instances, derived from the different degrees of cultivation. The hills are generally arched, and handsome ; the vallies open. The forests on the hills are a mixture of beach, maple, oak, and white-pine ; and in the vallies chiefly of hemlock, spruce, and fir. The soil of both appears to be well suited to grass.

Litchfield is apparently the most fertile tract on this road ; and except Topsham, the most cultivated. The meadows and pastures, the orchards, already numerous, and the crops of maize, furnish evident proofs of a good soil. We saw a collection of peach trees on one of the hills, which appeared to have grown well, but to have been sensibly injured by the severity of the climate.

It is a remarkable fact, that, although Litchfield was incorporated in 1795, and contained, in 1800, 1,044 inhabitants, not one of them has a legal right to the land, on which he lives ; all of them being what in the customary language of the Northern and Middle States are called *Squatters*. A Squatter is a person, who plants himself in the wilderness upon any piece of ground which he likes, without purchasing it of the proprietor. Large tracts of the country, recently settled in these States, have been occupied in this manner : but I have never been informed of any other instance, in which a whole township, and that township incorporated too, was holden by this violent tenure. In Litchfield and elsewhere in this District, in Vermont, New-York, and Pennsylvania, this evil has been followed by various acts of violence, done both to the proprietors, and to the ministers of justice : A deplorable

proof of inefficiency in the government, in defiance of which they were done.\*

Topsham is one of the most ancient settlements of this district : three planters having fixed themselves here about the beginning of the eighteenth century. All of them were, however, destroyed, or carried into captivity, together with their families. About thirty years afterward the settlement recommenced ; but being embarrassed with many difficulties and dangers advanced very little. Until the year 1760 the Savages were almost perpetually making inroads upon every defenceless settlement in this country. About the year 1750 the township contained eighteen families. It seems wonderful that an individual could exist so unhappily elsewhere as to be willing to fix himself in a situation so precarious.

The surface of this township strongly resembles that of Brunswick ; from which it is separated only by the river Ameriscoggin. The soil of the different divisions is, also, in each case the same. A village rather pleasant is built on the borders of the river. No pauper has been maintained in this township ; nor has any one ever applied for such maintenance.

Topsham contains one Congregation. In 1790 the number of inhabitants was 826 ; in 1800, 942 ; and, in 1810, 1,271.

Between Topsham and Brunswick, immediately above the bridge, a ridge of rocks crosses the river Ameriscoggin, and forms a magnificent cataract. At this place a great number of saw-mills are erected. An immense quantity of logs is brought down this river,

\*This subject needs, as I have since found, some further explanation. A great part of these lands were originally cultivated as mere possessions ; the occupant intending, in very many instances, to purchase the fee whenever he should find a legal owner : a matter not unfrequently attended with a good deal of difficulty, because the lands have been repeatedly granted, and the fee is challenged by different persons. When the occupant sold it he conveyed a title to its *improvements only*. During the long continued uncertainty concerning the legal proprietors, many of these lands have been sold several times, and the improvements made on them have become much more valuable than the lands themselves. From these facts difficulties have arisen, to remove which has demanded all the wisdom of the legislature. In Litchfield and probably in most other places the principle of adjustment has been established and the original titles in most instances are extinguished.

and sawed at these mills. Hence they are floated two miles lower down to the head of navigation.

The river Ameriscoggin rises in the White Mountain range, and on the Western side of that range, a little below the forty-fifth degree of latitude. For about forty miles its general course is directly South. In its passage it receives the waters of lake Umbagog, and of several other smaller lakes. It then steers a course generally East, about forty or fifty miles more, when it turns again to the South, and then again to the East, emptying its waters into the Kennebeck at the place called Merry-meeting Bay. Its whole course with its various windings probably exceeds one hundred and fifty miles.

The Kennebeck is a noble river. Its fountains are imperfectly known. The West branch rises near Umbagog lake; and running, first a Northern, and then an Eastern course, through a tract of land containing one million of acres, sold by the State of Massachusetts to William Bingham, Esq. meets the Eastern branch about the middle of that tract, measured from East to West, and about one third the distance from the North towards the South boundary. The Eastern branch conveys the waters of Moose Head lake into the ocean. From this junction it runs generally, but circuitously, a Southern course to Georgetown, where it joins the sea. This river is not far from three hundred miles in length; and is navigable for ships forty-six miles. It abounds in fish, particularly in salmon.

I am, Sir, yours, &c.

## LETTER XXIII.

Tornado—Scarborough—Saco—Biddeford—Arundel.

*Dear Sir,*

I WILL now return to the journey which is the principal subject of these letters. On Sunday, October 8th 1797, it rained violently at Portland with a strong wind from the South-West. In the afternoon a tornado, the commencement of which, so far as I was able to learn, was at Upper Salem in the County of West-Chester, and State of New-York, passed over Ridgefield in Connecticut, and thence over Reading, New-Town, Huntington, Derby, Woodbridge, New-Haven, East-Haven, Branford, Guilford, and Killingworth; whence it directed its course over the Sound. At times it rose from the earth, and held its most furious career in a higher region of the atmosphere. Such was the fact at New-Haven; where, although its force was great, it did not blow with sufficient strength to do any material damage. At Upper Salem it destroyed orchards, groves, and buildings. At East-Haven it blew down the steeple of the Presbyterian church, and ruined several other buildings. It left many marks of its violence also at Branford, and some other places; while in others it did little or no mischief. This alternate rise and fall of a tornado, I have not seen mentioned; nor do I remember a storm of this kind, at so late a season, in any other instance.

On Monday morning, October 9th, 1797, Mr. L. and myself, left our hospitable friends in Portland with regret; and commenced our journey towards New-Haven, in company with J. S. Esq. lately one of the Tutors of Yale College; by whom we had been fortunately joined that morning. The day was pleasant; and the ride upon the whole agreeable. As I know not the exact limits of the townships on this coast, I am unable to determine whether we passed through any part of Cape Elizabeth, or not. No other places were mentioned to us, as lying on our road, but Falmouth.

Scarborough, and Pepperellborough, before we arrived at Biddeford, where we dined. The distance was eighteen miles. This part of our journey lay over a level country; the soil partly clay, partly stiff loam, and partly sand. The forest is composed of pine, birch, and other trees indicating a lean and cold soil: the houses are generally poor, and the husbandry is indifferent. The circumstances of the inhabitants may be easily conjectured.

Such are the appearances, which met my eye during my first journey along this road. In 1807 I found, that I had misjudged concerning the township of Scarborough. I knew, that this township was generally said to be good land; but from what I saw, when I first passed through it, was very little disposed to regard the report as well founded. In my second journey I was better pleased with its appearance. The surface is a handsome collection of easy slopes; and the whole aspect cheerful and pleasant. Both the buildings, and the agriculture, wore a new, and prosperous appearance. It ought, however, to be observed, that the direction of the road had been materially changed. Instead of taking a long circuit through Falmouth, it proceeded in a direct line to Portland; crossing the Stroudwater, near its mouth, over a new and expensive bridge, lately erected, and cutting off between three and four miles of the distance. On this part of the road Scarborough has perhaps always appeared better than on the former road.

This township was incorporated in the year 1658; and it is known to have been settled as early as 1642. Its sufferings from the savages were at times severe: but the settlement seems never to have been broken up. In one of their incursions they burnt a house, containing a quantity of maize. A part of this grain has been frequently turned up by the plough, within a few years past. In the year 1801, several kernels were given me by the Rev. Mr. Alden, of Portsmouth. They were charred quite through, and in a state of perfect preservation, although they had lain within less than one foot of the surface more than one hundred years. This is the strongest proof of the preserving power of charring, with which I am acquainted.

Scarborough includes two Congregations; and contained, in 1790, 2,225 inhabitants; in 1860, 2,099; and, in 1810, 2,094.

The name, Saco, has been colloquially applied, heretofore, to a village, formed on both sides of the river of this name, near its mouth, in the township of Pepperellborough on the East, and that of Biddeford on the West. This village is about five miles from the ocean; and the parts of it are connected by a bridge, extending from each shore to an island; the property of Colonel Cutts, for many years the principal inhabitant of this place. He is also the proprietor of the bridge, which is said to yield him a handsome profit from the toll. A Mr. Spring, who lives on another island a little farther up, was building a second bridge; intending to turn the travelling by his own house; which he expected to accomplish by making the passage free. At a small distance above this island, a ridge of rocks crosses the Saco; and presents to the eye of a traveller a noble cataract, descending forty feet in a great variety of wild and magnificent torrents. On this fall is a collection of saw-mills, said to have cut four million feet of boards, annually, before the late American war, and to furnish, still, a very great quantity. The Saco is navigable for vessels of one hundred tons to the foot of this fall. Logs are floated down to these mills from the distance of sixty miles. As the lands on both sides are not likely soon to be cultivated, they may, if prudently managed, continue for a long time to yield a large supply of timber. The river is well furnished with fish; particularly with salmon and shad.

We saw little in this settlement, which could be termed agreeable. The declivities, on which it is built, are rude and irregular, but neither beautiful nor fertile. The soil is principally clay; always an unsightly, and uncomfortable, basis of a town: in dry seasons scarcely tolerable on account of the dust; and in wet, on account of the mud. The houses appeared to have been placed by accident; and except a small number were ordinary, and in many instances decayed.

The inhabitants were casually gathered here by mere business. Saco is, a busy, bustling place; and one of the principal seats of the lumber trade. Near the mouth of the river, on the Western

side, is an excellent harbour called the Pool; where vessels of any burden may find safe anchorage at all seasons. Between this harbour and the river, a canal, it is said, might be cut without much difficulty.

When I passed through Pepperellborough in 1807, then legally named Saco, I found its face almost entirely changed. A considerable number of new, handsome buildings had been erected since the date of my former journey: most of them on the plain above the bank. The inhabitants had also built a new and beautiful church: a structure, superiour to any other, which I have seen in this district, and inferiour to very few in New-England.

Pepperellborough contains one Congregation. The number of its inhabitants, in 1790, was 1,352; in 1800, 1,842; and, in 1810, 2,492.

This is one of the oldest settlements in Maine. It was granted by the Plymouth Company to John Oldham, and Richard Vines, in the year 1629. Oldham, I suppose to have been the man, who in 1636, was murdered near Block Island by the Pequods. In 1636, the inhabitants of Saco, taxed themselves for the maintenance of public worship. This settlement suffered, in common with its neighbours, from Indian depredations: but I have not, hitherto, been able to find any satisfactory history of these sufferings.

Biddeford I found much less improved than Saco. I know of nothing in it, particularly claiming the attention of a traveller. It contains one Congregation. The number of the inhabitants, in 1790, was 1,018; in 1800, 1,296; and, in 1810, 1,563.

Between Biddeford and Kennebunk the ground is a cold, barren plain; which wears, and will, I suspect, wear for a long period, a desolate aspect. A few, solitary settlements have been made here; but it is chiefly a forest of stunted pines. The road is disagreeable; being encumbered with a multitude of small rocks, and left absolutely without any repairs. The houses are dismal cottages, placed on little tracts of cleared ground, which can never repay the labour, either of the scythe, or the sickle.

The inhabitants seem to have planted themselves here, because they could go no farther, or because they know not whither to go. This tract is, I suppose, partly in the township of Arundel.

Arundel was anciently called Cape Porpoise, and contains a village on the point, which bears that name. It was settled about the same time with Saco; and, from the position of the village, seems to have suffered little from the savages. The other parts of this township must be more advantageously situated, than those which we saw: for in 1790, it contained 1,802 inhabitants; in 1800, 1,900; and, in 1810, 2,371. It includes a single Congregation; and was incorporated by its present name in the year 1718.

Kennebunk is a lively, flourishing village, containing a considerable number of houses, surrounding a decent church. A brisk trade in lumber is carried on here by means of the river Mousum, which passes through it, and is the boundary between the townships of Arundel and Wells. The Rev. Mr. Little, Minister of Kennebunk, mentioned heretofore in the description of the White Mountains, has, for many years, been occasionally employed as a Missionary among the Penobscot Indians.

We dined at Biddeford with an agreeable circle of gentlemen; and, in the afternoon, rode to a very good inn, in the interior of Wells. Our distance should have been about twelve or fourteen miles: but, as we unfortunately lost the road, we made it sixteen or eighteen.

In the morning, Tuesday, October 10th, we left our hospitable inn, not a little pleased with our entertainment; and rode through Berwick to Somersworth, where we dined, and, being detained by a heavy rain, lodged also, at the excellent house of Captain R. heretofore mentioned. The distance was seventeen miles. Here we spent our time very pleasantly with the Rev. Mr. Little; and received from him a great number of interesting observations concerning the District of Maine, and particularly concerning the Indians of Penobscot. I requested him to commit to writing the knowledge which he had acquired of this tribe. He informed me, that he had already done this, to a considerable ex-

•

tent, in compliance with a similar request from a gentleman in Boston ; in whose hand the manuscript then was. This, I presume, has been since published in the Collections of the Massachusetts Historical Society. Mr. L. communicated to us, also, the particulars of the visit, which he made to the summit of Mount Washington. In the journey of 1807 I found Kennebunk greatly improved both in business and appearance ; and Berwick, and that part of Somersworth, which borders on the bridge over Salmon Fall river, in a less degree. Dover was scarcely altered at all, except by the erection of one handsome house. A good turnpike road had, however, been made from the neighbourhood of this bridge to Dover ; by which the distance was shortened, and the travelling rendered much more agreeable. The toll-gatherer at Pascataqua bridge informed me, that the income amounted annually to \$4,000.

I am, Sir, yours, &c.

## LETTER XXIV.

Maine—Its Climate—Coast—Soil—Manner of Settlement—Difficulties encountered by the first settlers—Their Character.

*Dear Sir,*

BEING now about to quit the District of Maine, I will give you such general observations, as I have had an opportunity to make concerning this country.

The District of Maine lies between 43° and 48° North latitude. Its length and breadth are not far from two hundred miles; and its area is about thirty-five thousand square miles; half of the contents of New-England. The climate is colder than that of any other country on the coast of the United States; but not so cold, as to prevent mankind, when possessed even of moderate property, from passing through the year comfortably and cheerfully. The winter is less severe than at Quebec; in the North of Poland, or of Germany; or the middle of Russia. To this statement the most Northern angle, made by the Southern boundary of Lower Canada, and the Western boundary of New-Brunswick, furnishes an exception. The difference in the progress of vegetation, between Kittery and Passamaquoddy is about fifteen days. In the quantity of snow which falls throughout this extent, there is no material difference. The summers are pleasant; and sufficiently warm to bring maize, of several kinds, to perfection; warmer, of course, than in any part of Europe, above the forty-sixth degree of latitude. In the years 1796, and 1797, I visited the South-Western parts of this District. In the former year there was no appearance of frost, so late as the sixth of October; nor in the latter, so late as the eleventh. In 1807 there was, if I mistake not, a frost some time in September. But the same thing happens, at times, in Pennsylvania: and frosts in October have been severe in Georgia. Several of the inhabitants informed me, that they do not usually commence in Maine before the first of this month. The climate is remarkably salubrious:

and probably no country in the world sees a greater proportion of children reach the age of twenty, or of its inhabitants surpass that of seventy years.

The surface of a country so extensive will naturally be supposed to be various. In the South-Western parts are extensive plains. Farther Eastward, and Northward, the surface is to a great extent formed into hills and vallies. Beside the high grounds, which separate this District from Lower Canada, it contains few mountains. Agamenticus, a round eminence rising in the township of York, has from its situation been more noted than any other.

Maine is every where intersected by brooks and rivers. The considerable streams are the Saco, the Ameriscoggin, the Kennebeck, the Penobscot, and the Schoodic. The river St. John's, also, has its fountains, and a considerable part of its course, in this District. The Kennebeck is navigable for ships forty-six miles; and the Penobscot, about fifty. Both are also navigable for boats for a considerable distance; but are interrupted in several places by falls and rapids. The waters, throughout, are pure and salubrious.

The Coast of this District is indented by numerous harbours, perfectly safe, and sufficiently deep and capacious, to receive any number of vessels, of any size, which can ever be supposed to resort to this region. In this respect no part of the Union can be compared with Maine. Both the rivers, and the sea which washes this coast, abound with fish of excellent kinds, in quantities inexhaustible. The forests of this country consist of pine both yellow and white, maple, beech, oak, birch, fir, spruce, &c. The white pines are of sufficient size for masts, and spars, of every description. The native animals are now few. I know of none, which are not common to other parts of New-England.

The Soil is very various. A great part of the coast, for a few miles in breadth, is cold and unproductive. The plains, also, are partly of a cold and stiff loam, and partly of sand, sufficiently warm, but lean, and with the existing husbandry scarcely worth cultivation. It is not improbable, that gypsum might render them

fertile, as it has others of the same quality elsewhere. The hills, and vallies, are naturally good land, and well fitted for all the agriculture of this climate. Few intervals, it is said, are found in this District.

Were I to estimate the lands in this country according to the best information which I have been able to obtain, I should say, that one third of them were rich; another third of a middling quality; and the remaining third indifferent, and in many instances very poor. Yet the poor lands will, it is to be remembered, yield fuel; and may by skilful cultivation be often rendered productive. For those on the coast, which are usually the worst, the sea-weed, thrown upon the shore, furnishes an inexhaustible body of manure. A tract between the rivers Americoggin and Penobscot, commencing generally about forty miles from the ocean, and extending far into the interior, is considered here as exceedingly good. Probably other tracts, farther Eastward, may be found, of the same quality, when the country shall have been sufficiently explored. Upon the whole, it will be no immoderate calculation to suppose, that, with its advantages for agriculture, fishing, and commerce, Maine may hereafter easily support from four to five millions of people.

This District contains a very great number of Lakes. The largest of these are Umbagog, and Moose Head. The length of the former is said to be seventy miles. The latter is, however, still larger, although its dimensions are imperfectly known. Smaller ones are met with almost every where; and, while they contribute to render the climate milder, and more equable, are unceasing variegations, and exquisite ornaments of the landscape.

This District is now rapidly advancing in its population. Immigrants are crowding to it from New-Hampshire, Massachusetts, and Rhode-Island; and some even from Connecticut; the stream of whose surplus population has been long running towards the West, and South.

When a traveller remembers, that the first settlements in New-England were begun here; and that, with a few short intervals, they have been continued ever since; he naturally wonders why

this country should, for so long a time, have been so thinly inhabited, since such numbers now regard it as a desirable residence. The following observations may in some measure explain this subject.

When the first settlers planted themselves in Maine, their object was not husbandry, but commerce and fishery. Fishermen, and casual traders, are never, in the proper sense, Colonists. Neither their views, nor their habits, qualify them to convert a wilderness into a permanent residence. Men, accustomed to patient labour, of persevering firmness, and superiour even to the real ills of life ; men, influenced by some great and commanding motive, connected with a settlement on the soil, such as the hope of civil or religious freedom, or the necessity of providing for an increasing family ; are the only persons, fitted to subdue forests, encounter frost and hunger, and resolutely survey the prospect of Savage incursions. Traders and fishermen will stay in any place, while they can trade, and fish, with advantage : but they commence their business with an original intention of retreating as soon as their gain is acquired, or the acquisition becomes hopeless. From the first settlers, as they are called, of Maine all, that could be rationally expected, was that, which actually took place. They traded, caught fish, and went home. Such, chiefly, were the visitors of this country for the first fifty years.

All the evils of climate, and all the discouragements of soil and surface, were in a high degree felt by these people. The winter is sufficiently cold to terrify, at first, any European, educated South of the fifty-second degree of North latitude, unless born on the sides of the Alps or Pyrenees ; and much more, men accustomed only to the mild winter of England. The soil of the coast is generally cold, and lean ; and the surface by no means inviting. All these facts the settlers, mentioned above, published so generally, that until the close of the Revolutionary war Maine was considered as little less than an immense waste, unfit for the habitation of man. To the complete establishment of this character travellers, who visited only the same grounds, and the inhabitants, who resided on them, jointly contributed. Except in

some small tracts, principally in the County of York, scarcely any husbandry was pursued in this extensive country. The few persons, devoted to this business, were so unskilful, as to employ their labour, even here, with much less advantage, than the same soil and climate would have furnished to abler hands. The only visible effect of their industry was, therefore, a collection of half-starved crops, growing on grounds wretchedly prepared, and serving only to discourage future attempts of the same nature. So general was the prepossession against the possibility of successful agriculture, that, as I have observed, the people of Standish were astonished to see, (and that, several years since the Revolutionary war was finished,) their first crops come to perfection. Until this period almost all the inhabitants were merchants, land-jobbers, sawyers, lumbermen, or fishermen. Both the corn and meat, on which they fed, were imported from Connecticut, and some other States. These facts completely riveted the opinion throughout New-England, that the lands in Maine were of little or no value; and that farmers could not here obtain even a subsistence.

A number of the people, however, were real colonists; and came to this country with an intention to cultivate the soil. These persons met with endless perplexities in the numerous, interfering, and contradictory grants, made in England, of these lands;\* distracting those who were in possession; and bringing upon them the litigation and distress, produced by the claims of other grantees, who had, or pretended to have, as good or better titles than themselves. Disputed titles will effectually prevent the regular settlement of any country. Had Maine been originally granted in regular townships by a government, sufficiently acquainted with the country, and sufficiently attentive to the interests of the grantees, to make out consistent patents, and to invest the grantees with the proper powers of internal government; the settlement of the country would undoubtedly have advanced with a more rapid progress. But the government of Great Britain was at that time too ignorant of the country, and too careless about

\* Hubbard, Sullivan, &c.

the concerns of the adventurers, to do either. From this ignorance, and unconcern, probably arose another serious discouragement. The French, in the neighbourhood of whom Englishmen have hitherto never been able to live peaceably, began, early, a settlement on the Eastern shores of this District. The French government, originally in the year 1603, granted this tract, together with the rest of New-England, New-York, New-Jersey, and a great part of Pennsylvania, or in other words the whole country between 40° and 46° North latitude, to Monsieur De la Motte; who took possession of it, in 1604, by planting himself in the District of Maine. In the following years several other scattered settlements were formed, as far Westward as Kennebeck river. In 1613, Sir Samuel Argall dispossessed the French; and carried the settlers to Virginia. Charles I. gave it up to them again. From this time the French, though repeatedly driven off, renewed their settlements: and the inhabitants, of both nations, experienced the usual distressing vicissitudes, attendant on the frequent wars between the English and French, and peculiarly felt by the Colonists of the contending nations bordering on each other. No habitation was for any length of time safe from the flames; and no person from plunder, captivity, or death. In this hazardous situation the people of Maine continued for a long time. You will not wonder, that the settlement of the country did not proceed.

In 1675, Philip's war, which affected all the Indians in New-England, and embarked most of them in actual hostilities, spread its influence over the Indians of Maine; and produced among its exposed inhabitants the customary horrors. The people were few, scattered, and almost defenceless. Their brethren, in Southern New-England, were too distant, and too much occupied in their own defence, to lend them the assistance, which they needed. The Indians of Maine were too numerous to be attacked by these few Colonists with any hope of success; and too well secured in the fastnesses of an immense, and unknown, wilderness to be pursued with any prospect of advantage. In the subsequent wars these Indians were so engaged in the interests of the French,

that they continually took their part against the English. Nor were the inhabitants finally safe from their incursions till the peace of 1763.

Another cause of the slow progress of settlement has been found in the character of the inhabitants. These, heretofore, have been chiefly lumbermen, and fishermen. Both these classes are usually employed, during the mild season, in severe toil: and not a small proportion of those, belonging to both, spend the winter in idleness and dissipation. At the same time, very many of them are in a great measure destitute of property through life. This is, indeed, less extensively applicable to fishermen; some of whom almost every where, and most in towns distinguished for sobriety, acquire at least a comfortable living.

But those who are mere lumbermen are almost necessarily poor. Their course of life seduces them to prodigality, thoughtlessness of future wants, profaneness, irreligion, immoderate drinking, and other ruinous habits. The farmers of New-England have never willingly resided among people of such a character. In the mean time also, other countries, labouring under few of these disadvantages, have offered to such, as were willing to emigrate, the allurements of an inviting climate, and a rich soil; where lands might be obtained at prices equally moderate. The stream of colonization, once begun, is naturally continued by the tidings of success, and by the strong ties of attachment, which prompt men to follow their neighbours and friends in enterprizes of this nature.

But, notwithstanding this uncommon assemblage of disadvantages, the progress of population in this District has become wonderfully rapid. Since the Revolutionary war, the Government of Massachusetts has ordered it to be explored by men of understanding, and integrity; and a great part of it to be surveyed, and to be divided into regular townships. It has been found, that the country contains large quantities of good land; and that it is capable of furnishing a comfortable residence, and sufficient rewards to well-directed industry. Not only merchants and fishermen, but substantial farmers have planted themselves in this District; and in great numbers. By these men agriculture is pursued with new

industry, skill, and success. Settlements are extensively spread over the interior; particularly on the borders of the numerous rivers; as well as along the coast. Business of every kind is carried on with an energy, which here was never before seen; and with a prosperity, which has outrun the most sanguine expectations. In the year 1790, this District contained 96,440 inhabitants. In the year 1800, they were increased to 151,719; and, in 1810, to 228,705.\* Its population is, therefore, ultimately secured: and all those parts of it, which are fitted to become a comfortable residence for mankind, will, within a moderate period, be probably filled with inhabitants.

The Moral and Religious state of this country is, extensively, like that of other recent New-England settlements. Beside the evils, resulting from the dissolute character of the two classes already mentioned, these people labour under other disadvantages.

The number of settlements is great; and many of them, having been lately begun, are small and feeble. In every such settlement the Gospel is preached occasionally only; and the children, being destitute of regular catechetical instruction, must grow up, of course, in a comparative ignorance of moral and religious subjects. There are here, unquestionably, many religious parents, who by a careful education of their children do much to remedy this evil, and extend a happy influence over the neighbourhoods around them. But the great support of religious education, is regular and enlightened, public worship: as religious education is, in its turn, the support of this worship. Wherever, therefore, the worship does not exist; such education must gradually, if not rapidly, decline. At the same time, the number of parents is great, who neglect the religious interests of their families altogether, and leave their salvation to the care of accident. In most new settlements a considerable proportion of the adventurers will, almost of course, consist of roving, disorderly, vicious men. In the regular, established society, in which they were born, they were awed, and restrained. On the new grounds, to which they resort, they are set loose; and usually break out into

\* In 1820 the number of inhabitants was 297,839.—*Pub.*

open licentiousness of principle and conduct. Their children, with such instructors, and such examples, ever before them, cannot fail, unless under some strong counter influence, of becoming nuisances; and will, but too naturally, educate the succeeding generation to the relish, and the practice, of every enormity.

In the old New-England townships, almost every man, woman, and child, has the use, at least, of a bible: and the great body of them, notwithstanding the opposition, which has been heretofore made in this country to Christianity, read this sacred volume more, I believe, than all other books. In addition to this supreme privilege, every family almost is in possession of some other valuable religious books. Most parishes, also, contain one, or more, social libraries; of which such books usually form a considerable part. But to these advantages the inhabitants of the recent settlements in Maine, and else where, must in a great measure be strangers.

Another evil, under which these people labour, is this. They came together from different parts of the country, with different educations, views, and opinions. Hence, when these settlements become sufficiently advanced to support a minister, they find themselves split into several sects: each too small, and poor, to maintain a minister for itself; and all too discordant to unite in maintaining one for the whole. These divisions generate unkindness, bickerings, and separation from each other; and end in alienation from Religion, and dissoluteness of manners. Wearied by such contentions, and seeing religion in no other form than that odious one of party zeal, some of them, at least, become persuaded, that party zeal is the real object, and Religion only the name. Hence the transition is easy to mere Nihilism, and a total disregard of moral obligation.

Another misfortune, arising from the smallness of such settlements, and the manner in which they are formed, is the influx of ignorant, wandering, and unprincipled preachers. These men, too lazy to labour, and therefore hopeless of any other than a wretched subsistence in their own proper spheres; often blown up with spiritual pride; believing themselves, as peculiar favourites, to receive immediate communications from heaven; assume

the character and employment of religious teachers. The precarious pittance, furnished by this business, miserable as it is, they consider as better than starving at home.

Another evil of the same nature is found in the character and influence, of many of those, who are considered as principal men in every newly settled country. Among these not a small number have risen to importance merely by their wealth. Adventurers at an early period, and sagacious in discovering those means of acquiring property, which are always opened by circumstances in the progress of civilization, they bought lands cheap, and sold them dear; and by dealing largely in this profitable commodity came suddenly to the possession of great estates. Multitudes of those, who came after them, being poor, became indebted to them and dependent on them. This originated a superiority and influence, which time and habit confirmed. Those, who acquire this influence, are in many instances, both ignorant, and licentious. It is, therefore, frequently exerted in favour of loose principles, and practices, and against those which are better. At the same time, a considerable number of the men of learning and talents are unhappily loose characters; and encourage a licentiousness, harmonizing with their own wishes.

These observations are generally applicable to the new settlements, not only in Maine, but in New-Hampshire, Vermont, and New-York, also.

Another evil, existing in Maine, and perhaps elsewhere, is an indisposition in some of the regular Ministers to examine strictly, or even at all, Candidates for the ministry. The opinion appears to have spread considerably along many parts of this coast, that it is both unnecessary, and improper, to insist on a declaration of the Candidate's religious opinions, or an investigation of his attainments in Theology. This is termed liberality; but it is really the result of Indifference to Religion, or of love to Latitudinarian doctrines. It prevents, of course, any reasonable evidence of the Candidate's knowledge, or piety. In this way persons are easily introduced into the Ministry, who are destitute of both the literary and religious qualifications. Such Ministers must be far from *sparing*, and much farther from *feeding* the flock.

All these evils, except the last, will, I think, be gradually, and at no great distance of time, chiefly, if not wholly, done away. The several missionary societies in New-England are with a most commendable and successful, as well as zealous industry, sending preachers into these and other new settlements; who are generally men of sound principles, and unexceptionable lives. By these men the doctrines and precepts of the Gospel are, at intervals of no great length, preached in a great part of the recent settlements in New-England and New-York. A considerable knowledge of religion is thus diffused; and a sense of its importance excited, and kept alive. By the Missionary societies, also, Bibles, Testaments, and other religious books, are extensively dispersed among such, as are too poor to purchase them. Regular and respectable ministers are, in numbers continually increasing, settled in such towns as have become sufficiently wealthy to support them. The New-England education, and habits, like the principles very early taught to children, finally remain; and show their influence long after such, as look on, have despaired of seeing them revive. In instances, daily occurring, abundant proofs are given of the soundness of this opinion in the successful resistance, which they have made to many of these evils. Their happy efficacy will be increased hereafter by the emigration of the more restless, idle, roving inhabitants; who, as the state of society in these countries advances towards order and stability, will leave them for the same reasons, which induced them to quit the places of their nativity. Such men cannot continue in any regular society; but quit it, of course, for places, where they may indulge their own idle and licentious dispositions. Like a company of pioneers, they always go forward in the front of regular settlers; and seem to be of no other use, than to remove the difficulties, which might discourage the attempts of better and more quiet men. Accordingly, they have constantly preceded the real, substantial farmers in every course of emigration; and will probably precede them, until the New-England colonization shall be stopped by the Pacific ocean. The removal of these men, and the introduction of steady farmers, will both, greatly meliorate the moral con-

dition of these countries. The rising generation, also, will drop the zeal, feuds, and divisions, of their parents; and assume the general New-England character. The men, who now hold influence by wealth and accident, will be succeeded by those of superiour worth: and the prosperity and happiness of those towns, which have settled worthy ministers, will engage the imitation of others. The weight of infidelity will lessen, from the evil consequences, which it every where produces; and pity and contempt will soon be the only emotions, which it will excite. All these things, indeed, may not take place, as they are here stated. I do not mean to predict, but only to conjecture. In my own mind, however, there is little doubt, that the conjecture is founded on a solid basis.

To these observations I added, during my last journey to this District, the following.

No country in the United States possesses, in proportion to its wealth and population, so great a quantity of shipping, or so great a number of seamen. The period is not far distant when the inhabitants will avail themselves of all the advantages, which Providence has put into their hands. Those feelings of party, which, at the present time, prevent them in a great measure from discerning their true interest, and proper destination, will soon give way to more just, as well as more dispassionate, views. The District of Maine is fitted to derive its respectability especially from fishing, and commerce. The number of its inhabitants will soon equal that of the Dutch in Europe. Their territory is much more extensive; their climate at least, as favourable; their harbours more numerous, better, and during the winter, much more open; and the fish, to which they have an easy access, at least as abundant, and valuable. In enterprise, and activity, they will be outdone by no people on the globe. In spite of the prejudices, predominating in some parts of this country, a navy will grow up here of course; and seamen will be furnished to man it, not inferiour in skill, activity, and spirit, to those of any other country. From these sources they will necessarily obtain an important influence in the American Union.

Agriculture is improving in this District in two respects. The number of farmers is wonderfully increasing: and those, who are farmers, are much more skilful than their predecessors. The sober industrious husbandmen of Southern New-England are now emigrating in shoals to this country. The interior is settling in the New-England manner. Schools are established in great numbers. Churches, always decent, and not unfrequently handsome, are built. Worthy Ministers, qualified by their learning and piety for their office, are called for; and, when they can be obtained, are settled with as liberal stipends, as in other parts of the country. A scheme seems already to be formed, at least to a considerable extent, of settling this District on sober principles, and with wise institutions. The inhabitants begin to feel their consequence; to enlarge their views concerning the importance of their country; and to point their aims at more dignified and rational objects.

It has often been proposed to erect this District into a State. Conventions have assembled at Portland, several times, for this purpose. The State of Massachusetts has long been ready, and has declared its readiness by a legislative act, to consent to the separation. The inhabitants of Maine, however, have hitherto been unable to agree among themselves. Many have wished, and zealously laboured, to promote it; but a majority has always been found, inclined to continue in their present situation. The reasons, which have influenced them to the adoption of their different opinions, have been various. On the one hand ambitious men, who felt their own apprehended merit to be neglected, and their rivals unwarrantably preferred to them, looked forward with eagerness to this separation; as opening a field of action, more auspicious to their wishes, and promising an undoubted harvest of honours, and profits. The number of these is not small. Others, of fairer minds, more enlarged views, and more correct principles, have dreaded this event; lest, at so early, and fluctuating, a period in the progress of population, the system of government, resolved upon, should be so loose, and feeble, as to promote the purposes of public and private justice, peace, and safety, in a very

imperfect and ineffectual manner. They have believed, and I think justly, that a state of society, established on an infirm foundation, and unhappy principles, would extend a malignant influence through a series of generations. Men, who are possessed of offices under the present government, wished to retain them; and did not feel sufficiently assured, that they should possess offices of equal importance under the government, which was proposed. Many of these men had long been accustomed to spend the winter amid the bustle, amusements, luxuries, and eminently social intercourse, of Boston; and felt unwilling to lose these enjoyments, or the personal consequence of appearing there as representatives, or senators. Besides, pride is gratified in being connected with a great and powerful State; the splendour, and importance, of which, is felt by every member to belong in some degree to himself. A great part of the business, carried on by the merchants of this District, is connected with Boston in so intimate a degree, as to depend upon that connection for its very existence. The great body of men, concerned in this business, were naturally alarmed by any event, which might contribute to lessen this connection. The people at large, were, in the mean time, chiefly influenced by a still different, and more decisive, consideration. They were told, and with truth, that the new government would be more expensive to them than the old one. If Maine were to become a State, many new officers must be chosen; and the maintenance of these must be paid for by the inhabitants.

This District contains, as I have observed, half of New-England. Its population is increasing in a very rapid manner. Indeed it will very soon become so great, that, should a separation take place, the question may without impropriety be asked, whether Maine will be separated from Massachusetts, or Massachusetts from Maine.

A number of the most respectable inhabitants wish for the speedy arrival of this event. They believe, that in its present state of population it will become, and will long continue to be, one State; but, if the separation be delayed for a considerable time, that it will be divided into two.

The only material consideration to the inhabitants is the acquisition of a Government, and public institutions, founded on the combined principles of freedom, energy, learning, good order, and religion. These blessings I most cordially wish them and their descendants to acquire, and enjoy, throughout every succeeding period of time.\*

I am, Sir, yours, &c.

\* The District of Maine was received into the Union as a State in 1820.—*Pub.*

## LETTER XXV.

Madbury—Epping—Chester—Londonderry—Nottingham West—Dunstable, N. H.  
Dunstable, Mass.—Lovewell's Excursions—Groton—Indian Depredations.

*Dear Sir,*

ON Wednesday, October 11th, we left the excellent house of Capt. R. and rode through Dover, Madbury, and Epping, to Chester, thirty-five or thirty six miles. Mr. L. left us at the bridge, to pursue his rout along the Eastern shore to Boston, and thence through Providence and Newport to New-Haven.

On my return from Hallowell in 1807, I had an opportunity during my continuance at Portsmouth to observe the alterations, which had been made in this town; as I also had in a journey, which I made to it in the year 1801. Two great fires had consumed a considerable part of Portsmouth. The vacancies, produced by these conflagrations, have been entirely, or nearly, filled up with several rows of handsome brick buildings; generally of four stories. Most of these are stores; and, except in Boston, are, as a whole, not excelled in New-England. Many new and beautiful houses have also been erected; and the whole aspect of the town has been essentially improved.\*

\* On the 26th of September, three days after we passed through Portsmouth on our journey in 1807, Colonel Walker of this town went out on a shooting excursion at four o'clock in the morning. For this purpose he embarked in a small boat with an intention of crossing the Pascataqua. When he had passed over about half the breadth of the river, a severe spasm seizing him in the head, sensibly affected his sight, but left him in full possession of his understanding. Apprehending that his situation was dangerous, he immediately turned his course back towards the Portsmouth shore; and, as the flood tide then flowing with great strength forced him up the river, he steered towards a small wharf about three-fourths of a mile above the town. As the boat came near the wharf, he laid the end of a paddle, which he held in his hand, upon a corner of the wharf; in order to lay the boat by its side. But the tide forced him away. He then attempted to reach a rocky point, a few rods above; but while he was in the act of making a stroke with his paddle, by some accident or other he missed the stroke, broke the paddle, and fell into the river where it was about ten feet deep. As soon as he rose above the surface he endeavoured to swim; but being unskilled in the art, and encumbered with his clothes and boots,

The Ecclesiastical concerns, both of Portsmouth and its neighbourhood, have been less prosperous. Except the Congregation of the Rev. Dr. B. which is very large and flourishing, there is scarcely one, which has not within a few years had serious intrusions made upon its welfare. Several respectable Clergymen have died; others have been removed; and others, distressed by long continued diseases.

I have mentioned the storm, which overtook me and my companions just before our arrival at Portsmouth in 1807. It began to rain here at half after four, P. M.; at Boston, about nine, A. M.; at New-London, and New-Haven, early in the morning. Its progress against the wind was therefore irregular, and much slower than in the instances, unitedly observed by Doctor Franklin and Professor Winthrop. According to their observations, rain is

found himself unable. When he perceived that he must sink again, he turned his face towards the shore; designing when he should reach the bottom to make his way to the spot where he hoped to land, by creeping. Accordingly, as soon as he felt the bottom, he made the most vigorous exertions for this purpose; and, when he rose again, had advanced so far towards the shore as to be able to raise his head above the water while his feet touched the bottom. He then walked to the shore which he reached about an hour before the sun rose. Hence he ascended the bank; and walked up the river with the hope of finding some person who might assist him to recover his boat.

To this time Colonel Walker had retained full possession of his reason; but, as he supposed, he now fainted and fell, and had afterwards no distinct recollection of his circumstances until a little before noon on Monday the 28th. Still he retained a remembrance, which he styles imperfect, and visionary, of climbing over stone-walls, groping in a corn-field, and endeavouring to reach his house before the news of taking up his boat should alarm his family. The course which he took to find his house he could not remember; and probably did not contrive nor distinguish. But he evidently spent the whole of Saturday, Sunday, and a part of Monday, in attempting to find his way thither. The spasmodic affection which he mentions, the anxiety and flutter of spirits which he suffered during the time while he was in and under the water, and the excessive fatigue occasioned by his extraordinary exertions to regain the shore, affected both his body and his mind in such a manner as to leave him absolutely bewildered. Two days he seems to have wandered in the cornfield and its environs; and two nights to have slept, if he slept at all, within the same narrow limits; and all this on ground, which he must have familiarly known. After he had reached the town on Monday morning he made a variety of attempts by wandering through different parts of it, as he afterwards remembered, to find the way to

supposed to commence at Philadelphia, in a North-East storm, such as this was, four hours sooner than at Boston.\*

Madbury, Epping, and Chester, are all farming towns. The surface is undulating; the soil, and the cultivation, moderately good; and the houses decent. Chester, the best of these townships, contains a village of well appearing houses, around a neat church. Epping is inferior to it; and Madbury to Epping. Madbury was incorporated in 1755; Epping in 1741; and Chester in 1722.

Madbury contained in 1790, 592; in 1800, 544; in 1810, 582 inhabitants.

Epping contained in 1790, 1,233; in 1800, 1,141; in 1810, 1,182 inhabitants.

Chester contained in 1790, 1,902; in 1800, 2,046; in 1810, 2,030 inhabitants.

his own house; but failed in them all. About five o'clock, P. M. he was discovered and conducted home by some bakers in the neighbourhood.

To this account taken from Colonel Walker himself, Dr. Buckminster adds, "Upon coming to the bake-house, to which he was probably directed by the light of the oven, Colonel Walker asked the men; whether they knew where he was, and who he was, and whether they could conduct him to his house. The bake-house was within sight of the house of Colonel Walker; and directly behind the church where he had worshipped for thirty years. After he came home he was put to bed. Within an hour I visited him, and found him in a great degree of perturbation. He knew me however; as he had known his wife, and several of his family, at his first coming home. But he could not be convinced that it was Monday, and not Saturday, morning. In my hearing he urged his wife to send a messenger unto a company of men who under his superintendance were working on a road, to tell them that he was unable to give them directions, and that they must therefore disperse." Within a few days Colonel Walker was so far recovered as to attend to his customary business; and not long after regained his usual health.

I have recited this story because it exhibits man in an attitude, which, so far as I know, is absolutely new.

\* Subsequent observation has convinced me, that the irregularity mentioned in the text is not uncommon; although I am unprepared to say that it is predominant. On Tuesday, the 3d of May, 1813, began at New-Haven a storm attended with rain. Both continued, with some interruptions, five days. The quantity of water which fell was five inches and a half. At Norwich it began to rain on Wednesday, and at Boston, on Friday.

Madbury is in the County of Strafford ; the other townships are in the County of Rockingham.

In the township of Chester there is a round eminence, called Rattle Snake Hill ; which is esteemed a curiosity by the inhabitants. On the Southern side of this eminence there is, it is said, at the height of thirty or forty feet from its base, a cavern, from fifteen to twenty feet square ; from the ceiling of which depend a number of stalactites, whose polished surfaces reflect the light of a torch with uncommon brilliancy.

From Chester we rode, the following day, through Londonderry and Nottingham-West ; crossing the Merrimac, through Dunstable, (N. H.) and Dunstable, (Mass.) to Groton : thirty-three miles. The road on both these days was, for one so obscure, tolerably good.

Londonderry is a large farming township ; one of the best in New-Hampshire. Its surface is less undulating than that of the three preceding ones : the soil is better. The houses are generally good ; and, together with the husbandry, indicate the prosperity of the inhabitants.

A colony came to this town, at an early period, from the North of Ireland. Their descendants constitute a great part of the present inhabitants. Soon after their arrival they began to manufacture linen, and thread ; and have ever since carried on this business, to a considerable extent ; dispersing the products of their industry through many parts of the neighbouring States. This is the most considerable, and I believe the most respectable, colony of Irish emigrants, which has been planted in New-England.

Londonderry was incorporated in 1722. In 1775, it contained 2,590 inhabitants ; in 1790, 2,672 ; in 1800, 2,650 ; and, in 1810, 2,766. This township was first planted in 1718 ; settled its first minister in 1719 ; and contains two Congregations ; both Presbyterian in the proper sense.

After leaving Londonderry we passed through a part of Nottingham-West. Of this township we saw nothing, except a lean plain, forested with yellow pines. I have rarely seen a less in-

viting spot. In other parts it must undoubtedly possess a better soil, as, in 1775, it contained 999 inhabitants; in 1790, 1,068; in 1800, 964; and, in 1810, 1,063. It includes one Congregation. We crossed the Merrimac at Kenney's ferry, a few miles above the great bend at Dracut. The river is here forty rods in breadth, and about ten or twelve feet in depth. The current is extremely rapid; a great quantity of water is therefore conveyed through its channel.

The Merrimac has been often styled a barren river; and with much propriety. Throughout a great part of its length, besides being obstructed by numerous falls, its current is too rapid for convenient navigation. A considerable proportion of the lands along its banks above the bend are said to be lean; and to a great extent composed of yellow-pine plains. Few fish are found in its waters. The largest branch of this river has its springs in the Southern part of the White Mountains whence it runs about one hundred miles. Its fountains are nearly on the same level with the Connecticut, which runs a course of four hundred and ten miles. Hence the Merrimac must have a rapid descent to the ocean, or furnish an obstructed navigation. It is attended with both these disadvantages. As a balance for these evils, all the New-England rivers, except the Merrimac and the Saco, have fertile borders; and all of them consist of pure, salubrious waters. The inhabitants, planted on their borders, are equally healthy with those on the hills; and, on the Eastern side of the Green Mountains, are strangers to agues and intermittents; evils, attendant upon all the rivers South of New-England, and constituting a serious drawback on the superiour navigation, furnished by several of them to the interior country.

After we had crossed the river, under the auspices of a ferryman, who seemed very much like a stranger to the world in which we lived, we entered Dunstable in New-Hampshire. The land still continued to be a pine plain, of the same lean soil, for several miles. As we entered Dunstable in Massachusetts, it began to rise into small swells, thinly dispersed, covered with oak, &c. and presenting a soil somewhat better. The houses, which we

had seen on the plain, appeared as if they were intended to accord with the soil. At one of them, which hung out a sign, informing us that it was an inn, we called for a dinner; but could get nothing either for ourselves or our horses. We had rode twenty-four miles without stopping; and were told, that there was no other inn in the neighbourhood. The case admitted of little deliberation. It was therefore speedily resolved, that we would apply for the necessary entertainment at the first house, which should wear a promising appearance. We had made but little progress, when several good houses were in sight. One of these was soon pitched upon, with a determination, if importunity could prevail, not to take a refusal. Accordingly we rode up to it; and sent in our message by a lad, who soon returned with an answer from his mistress, according with our wishes. The lad took charge of our horses; and we were welcomed to the house by a respectable lady, and her agreeable family. A handsome dinner was speedily set before us; accompanied, and followed, by a course of polite, sensible conversation. In the progress of it we discovered that we were at the house of Mr. K. the Clergyman of the town. He was from home: a circumstance regretted both by Mrs. K. and ourselves. We had called for a dinner, with the declared purpose of paying for it. It is unnecessary to mention the embarrassment, into which we were thrown by this untoward fact. The proposal had been made, and our character committed. We were therefore compelled to repeat the disagreeable condition. It was, I need not say, very delicately declined, with a visible concern for our embarrassment. At the same time we were politely informed, that the family would esteem themselves amply compensated for the trouble which we thought we had occasioned, if, whenever we might pass through Dunstable, we would give them the pleasure of entertaining us again.

Dunstable was incorporated in 1746. In 1775, it contained 705 inhabitants; in 1790, 632; in 1800, 862; in 1810, 1,049.

The celebrated Captain John Lovewell, distinguished as a partisan in Indian wars, was an inhabitant of Dunstable. This gallant man, whose exploits were the theme of frequent conversation

when I was a boy, having gained some slight advantages in an excursion against these marauders, assembled a company of seventy men in the year 1725; the third year of the war, which is still called Lovewell's war; and set out on a second expedition. He was, however, obliged not long after to dismiss thirty of his followers. With the remainder he proceeded through a part of the country, North of Winipiseogee lake, until a smoke, seen a little before sun-setting, advertised him, that he was near the enemy. Lovewell and his men concealed themselves till after midnight; and then, advancing with great circumspection to the spot, found ten Indians asleep by a fire. All of them, except one, they killed outright; Lovewell himself firing first, and dispatching two by a single discharge of his musket. The survivor, who was wounded, attempted to fly; but was seized by a dog, and held fast, until he was also killed. By this event an incursion, which had for some time been meditated, and was then actually commencing against New-Hampshire, was finally broken up.

Encouraged by his success, and by the rewards which they received for it at Boston, Lovewell with a body of forty-six men undertook another expedition against the Indians at Pigwacket.\* Before they reached the place of their destination, their number was reduced by various misfortunes to thirty-four. The remainder, having arrived at the confines of the Pigwacket settlements, heard, early in the morning, the discharge of a musket; and saw an Indian standing on a point, jutting into a pond. The preceding night they had heard several noises which they attributed to Indians; and suspected that themselves were discovered, and that this man was placed there as a decoy. Having held a consultation, they left their packs on the North-Eastern side of the pond,† and went onward. Two parties of the savages, amounting to forty-one, discovered, and counted, their packs; and, finding that the number of their enemies was less than their own, placed themselves in ambush to wait their return. The Indian, whom

\* About Conway.

† The ponds mentioned here are in the townships of Wakefield in New-Hampshire, and Fryburgh in the District of Maine.

they had seen on the point, met them, and wounded Lovewell, and another man, with small shot ; but was killed by Lieutenant Wyman. The company then returned to their packs ; and were instantly attacked by the Indians. Lovewell, and eight of his men were killed outright : Lieutenant Farwell and two others were wounded. Some of the savages, also, were killed. The English, perceiving that the savages were endeavouring to surround them, retreated towards the pond ; and took their stand in a spot, partly sheltered by the nature of the ground. Here they fought with such success, that the Indians, after having vainly endeavoured both to allure, and to intimidate them to a surrender, and after having lost a number of their own people, withdrew ; and left the field to Wyman and his companions. Of this brave little band, twenty-three survived the engagement ; two were killed outright, after the first assault ; twelve were wounded ; and three of them fatally. Beside these three, two, Lieutenant Farman and a clergyman who accompanied the expedition as chaplain, died of their wounds. The remaining eighteen, after many severe sufferings, arrived safe ; and were handsomely rewarded. A party went from Dunstable soon after, and buried the bodies of the slain ; except four, whom they could not find ; and cut their names upon the forest trees, which grew on the spot. The public, also, made an honourable provision for their widows and children. It ought not to be omitted, that, when the party left their three wounded companions after the battle, one of them, Ensign Robbins, begged them to charge his musket, and place it by his side ; that, if the Indians should return, he might have the satisfaction of killing another. The gallantry of this man, and of his companions, would in Grecian or Roman history have secured to them the wreath of immortality.\*

The Indians of Pigwacket were so terrified by this enterprize, that they left their habitations ; and did not return to them again until the end of the war.

After dinner, we rode through a part of Dunstable, (Mass.) and arrived at Groton in the beginning of the evening.

\* One of them, named Thomas Ainsworth, was living in Brookfield, (Mass.) in 1793.

Dunstable is a small town, near the North-West corner of Middlesex County, which contained, in 1790, 59 houses, and 380 inhabitants; in 1800, 75 houses, and 485 inhabitants; and, in 1810, 475 inhabitants. The surface here began to swell, and to be covered with oak, walnut, and chesnut. A better husbandry soon appeared; exhibiting proofs of thrift and prosperity. These appearances increased till we arrived at Groton; where we found again the good land, and the substantial farming character, so remarkable in the County of Worcester.

Groton, in the early periods of its settlement, experienced its share of Indian depredations. It was incorporated in 1655. In 1676, a body of savages entered it on the second of March, plundered several houses, and carried off a number of cattle. On the ninth they ambushed four men, who were driving their carts, killed one, and took a second: but, while they were disputing about the manner of putting him to death, he escaped. On the thirteenth about four hundred of these people assaulted Groton again. The inhabitants, alarmed by the recent destruction of Lancaster, had retreated into five garrisoned houses. Four of these were within musket shot of each other. The fifth stood at the distance of a mile. Between the four neighbouring ones were gathered all the cattle, belonging to the inhabitants.

In the morning two of the Indians shewed themselves behind a hill, near one of the four garrisons, with an intention to decoy the inhabitants out of their fortifications. The alarm was immediately given. A considerable part of the men in this garrison, and several from the next, imprudently went out to surprise them; when a large body, who had been lying in ambush for this purpose, arose instantaneously, and fired upon them. The English fled. Another party of the Indians, at the same time, came upon the rear of the nearest garrison, thus deprived of its defence, and began to pull down the palisades. The flying English retreated to the next garrison; and the women and children, forsaken as they were, escaped, under the protection of Providence, to the same place of safety. The ungarrisoned houses in the town were then set on fire by the Savages.

In a similar manner they attempted to surprise the solitary garrison : one of their people being employed to decoy the English out of it into an ambush in the neighbourhood. The watch, however, discovering the ambush, gave the alarm ; and prevented the mischief intended. The next day the Indians withdrew ; having burnt about forty dwelling houses, and the church, together with barns and out-houses. John Monoco, their leader, during the preceding day, with the same spirit, which is exhibited with so much vanity and haughtiness in the proclamations of General Burgoyne, the Duke of Brunswick when entering France, and General Le Clerk when attacking St. Domingo, insulted the inhabitants of Groton with his former exploits in burning Lancaster, and Medfield ; threatened that he would burn Groton, Chelmsford, Concord, and Boston ; and declared, amid many taunts and blasphemies, that he could do whatever he pleased. His threatening against Groton he executed ; but, instead of burning the other towns, he was taken a prisoner a few months afterwards, led through the streets of Boston with a halter about his neck, and hanged. His three compeers in haughtiness met with a fate, differing in form from his ; but by the inglorious and miserable end of their efforts are exhibited to mankind, as solemn monitions of the madness, as well as impiety, of arrogating to a human arm that disposal of events, which belongs only to God. One would think, that Sennacherib and Rabshakeh had long since taught this lesson effectually. For Monoco ignorance may be pleaded : for the Christian boasters there is no excuse.

As we arrived at Groton in the evening, and left it early in the morning ; and as our road passed by the body of the town at some distance on the right, we had no opportunity of observing it particularly. As we saw it, it appeared to be a very pretty village, pleasantly situated on an easy slope, and containing a considerable number of good houses, a Church, and an Academy. The country around it was apparently fertile. In 1790, the number of inhabitants was 1,840 ; in 1800, 1,802 ; and, in 1810, 1,886. The number of houses, in 1800, was 230. It includes two Congregations : one of them a Presbyterian proper.

I am, Sir, yours, &c.

## LETTER XXVI.

Shirley—Lancaster—Captivity of Mrs. Rowlandson—Mr. Sawyer—Sterling—  
Princeton—Rutland—Oakham—New Braintree—Brimfield—Monson—South-  
Wilbraham.

*Dear Sir,*

WE left Groton on Friday October 13th, and entering the County of Worcester rode through Shirley, Lancaster, Stirling, and Princeton, to Rutland: thirty-five miles. The road, for one of no more importance, was tolerably good.

This morning we saw the first frost of the season.

We passed only through a skirt of Shirley, and perhaps through another of Harvard. The face of the country was agreeable; and the soil good. Shirley was incorporated in 1753, and Harvard in 1732. Shirley contained, in 1790, 99 houses and 677 inhabitants; in 1800, 105 houses and 713 inhabitants; and in 1810, 813.

Harvard, in 1790, contained 198 houses, and 1,387 inhabitants; in 1800, 195 houses, and 1,319 inhabitants; and in 1810, 1,431.

Lancaster, the next in our course, is a beautiful township, situated on the river Nashua, a considerable tributary stream of the Merrimac. The surface is extremely pleasant, and even elegant. It consists of hills, vallies, and plains, finely interspersed with groves and orchards; and a succession of Intervals, to the amount of three thousand acres, border the meanders of the Nashua, and are annually overflowed, and manured, by its freshets. This variety of surface furnishes suitable soils for all the produce of the climate. The lands, at the same time, are rich, and the crops abundant. In the North-Eastern part of this township a quarry of slate, the first I believe, wrought in the United States, and supposed to be inferiour to none of those which have since been discovered, furnishes a plentiful supply of this valuable material, not only for the neighbourhood, but also for other parts of the country.

The houses in Lancaster are in many instances, very good ; and appear obviously to be the habitations of gentlemen. A greater degree of taste is conspicuous than in various other places, where the buildings are equally expensive. A number of polished people have always resided here : and the inhabitants at large have been distinguished for industry, sobriety, and good order. One of them, Colonel Caleb Wilder, was the author of the method of making potash in those large vessels, which are now known by the name of potash kettles.

Cumberry pond, a small piece of water in this township, is said to rise two feet above its common level immediately before a storm.\* If there be no error in this account, of which I confess my suspicion, it is probably a singular fact ; and well deserves a thorough investigation.

Lancaster was the first settlement in the County of Worcester ; having been sold by Sholan, Sachem of Nashua, to Thomas King of Watertown and his associates, in the year 1645. A few families then planted themselves in it ; and obtained an act of the Legislature, incorporating it by the name of Lancaster in 1653. Both Sholan and his successor were uniformly friendly to the inhabitants ; and during twenty-two years they lived in peace and safety. In 1675, Philip engaged the Nashuas in the scheme of extirpating the English. On the 10th of February, 1676, he marched against Lancaster with about fifteen hundred Indians : Narrhagansetts, Wampanoags, Nashuas, and others. At that time there were in the town about sixty families. The savages burnt most of the houses, and among them several, which were garrisoned.

One of these was the house of the Rev. Mr. Rowlandson, the minister ; who happened to be absent. After assaulting this mansion two hours they set it on fire ; killed twelve persons ; and took the rest prisoners. Mrs. Rowlandson was among the captives, together with one of her sisters, and the children of both. Another sister, her husband, and son, were among the slain. Mrs. Rowlandson was wounded by a musket ball, which went through her side, and at the same time through the hand, and bowels, of

\* Whitney.

the infant, which she held in her arms. The slain were stripped, mangled, and left naked. On a neighbouring hill, the Indians held a feast in consequence of their victory; and exhibited the spirit of triumph with all the excesses of savage exultation. The next day they began their march: and this unfortunate lady carried her child in her arms till, her strength being exhausted, she fell. They then furnished her with a horse, but without a saddle. She attempted to ride, but again fell. It began to snow. She gathered a few sticks, made a small fire, and sate near it upon the snow, with her child in her arms, till the next morning. From Wednesday night till Saturday night she had no other sustenance but water. By the advice of an English captive she put oak leaves upon her wound, and obtained a cure. Nine days she held her child in her arms, or upon her lap. During this time it had received nothing but cold water. At the close of the ninth day it expired, and was buried by the Indians. She was then sold by the Narrhagansett Indian, who took her captive, to Quannopin, a Sagamore, who married the sister of Philip's\* wife; a woman, in whom Mrs. Rowlandson found a most uncomfortable mistress. Soon after, a party of the Indians went upon the expedition to Medfield, which I have elsewhere mentioned. After their return, one of them gave her a Bible; which appears to have been her chief support, and consolation, during her captivity.

The latter part of this time she had continued with a numerous body of the Savages, not far from Petersham; in the Western part of this County. But the Indians, having been informed, that a strong body of the English was in pursuit of them, decamped suddenly, and hastened with the utmost expedition into the County of Hampshire; crossing in their way Paquage, or Miller's river; where the English, apparently from an apprehension, that they should not be able to overtake them, gave up the pursuit. The Indians continued their march to Connecticut river; and crossed

\* The name of this woman was Wettimore, another proof that the Mohekanews used the letter R. Quannopin had two other wives, and lived indifferently with any of the three as he pleased.

it, probably, into Gill, or Bernardston. Here they found Philip.\* The sachem treated her with civility; invited her into his wigwam; and offered her the common round of savage kindness. While she was at this place, the Indians went upon an expedition against Northampton. Speedily after they crossed the Connecticut again; and, with many interruptions, returned into the County of Worcester.

During this part of her pilgrimage, as well as the former, Mrs. Rowlandson went through almost every suffering, but death. She was beaten, kicked, turned out of doors, refused food, insulted in the grossest manner, and at times almost starved. Nothing but experience can enable us to conceive what must be the hunger of a person, by whom the discovery of six acorns, and two chesnuts, was regarded as a rich prize. At times, in order to make her miserable, they announced to her the death of her husband, and her children. One of the savages, of whom she enquired concerning her son, told her, that his master had, at a time which he specified, killed and roasted him; that himself had eaten a piece of him, as big as his two fingers; and that it was delicious meat. On various occasions they threatened to kill her. Occasionally, but for short intervals only, she was permitted to see her children; and suffered her own anguish over again in their miseries. She was also obliged, while hardly able to walk, to carry a heavy burden over hills, and through rivers, swamps, and marshes; and that in the most inclement seasons. These evils were repeated daily; and, to crown them all, she was daily saluted with the most barbarous and insolent accounts of the burning and slaughter, the tortures and agonies, inflicted by them upon her countrymen. It is to be remembered that Mrs. Rowlandson was tenderly and delicately educated, and as ill fitted to encounter these distresses, as persons, who have received such an education, now are, in this and other countries.

There was, however, among the Savages a marked difference of character. Some of them, both men and women, treated her

\* This is one among many decisive proofs, that Philip was the soul of the war throughout New-England.

with kindness. None of them exhibited so much insolence to her as her mistress. This woman felt all the haughtiness of rank, as much as if she had been an European or Asiatic princess ; and spent almost as much time in powdering her hair, painting her face, and adorning herself with ear-rings, bracelets, and other ornaments : a part of their plunder from the English.\*

The sufferings of Mrs. Rowlandson's captivity were terminated the 3d of May. Mr. Hoare, a gentleman of Concord, under a commission from the Government, redeemed her from the Indians for twenty pounds, contributed for this purpose by Mr. Usher and some ladies in Boston. At her return she found Mr. Rowlandson in good health ; and heard the joyful intelligence, that her two children, and the son of her sister, were also redeemed ; and soon saw them restored to her embraces. The kindness, which the family now experienced from their countrymen, was such, as Christians might be expected to exhibit to their fellow-Christians in a case of this extreme nature.

The whole number of prisoners, which were taken during this invasion of Lancaster was forty-two : more than half of them women and children. These the Savages preserved ; but they killed many of the men. About six weeks after the inhabitants left the town ; and all the buildings, except two, were burnt.

In 1680 Lancaster began to be settled again ; and enjoyed the blessings of peace for twelve years. In 1692 the Savages renew-

\* On a particular occasion which occurred during Mrs. Rowlandson's captivity, these Indians had a dance. The company seems to have been composed chiefly of persons of distinction. Among others, Quannopin and his wife were present, and were dressed with great splendour. Wettimore was covered with a profusion of wampum ; and her arms, from the elbow to the hand were covered with bracelets. " She wore," to use Mrs. Rowlandson's language, " handfuls of necklaces about her neck : her stockings were red, and of a fine texture : her shoes were white : her face was painted : and her hair was covered with powder."

The music to which they danced was partly singing, and partly beating upon a kettle. While they were dancing the company threw wampum to the bystanders.

Wettimore seems to have been distinguished from all the other Indian women by haughtiness of spirit and demeanour. She treated Mrs. Rowlandson with the same insolence which a West-Indian dame sometimes exhibits to her slave ; and was not less remarkable for the want of every humane feeling than for her pride.

ed their assaults upon this unfortunate town. In this and the five succeeding years they destroyed a considerable number of the inhabitants; and among others the Rev. John Whiting, their minister. In 1704, in the war commonly called Queen Anne's war, a large body of the French and Indians, originally destined for the destruction of Northampton, but diverted from their design by the preparations which they found made for their reception, fell upon Lancaster the 31st of July. They were warmly and resolutely resisted by the inhabitants, aided by a party of soldiers in the garrison commanded by Capt. Tyng, and a company from Marlborough commanded by Capt. Howe. But, being greatly superiour in numbers, they drove the English into the garrison; burnt the Church, and six other buildings; destroyed many cattle; and slew several of the inhabitants. A number of men, from other towns, came to their assistance before night, and forced the enemy to retreat; but could not overtake them. They were supposed to have suffered considerably in the conflict. The same year Mr. Gardiner, elected by the inhabitants of Lancaster as their pastor, was, while he was keeping watch, heard walking by one of the garrison, mistaken for an enemy, and shot.

The same year, a Mr. Sawyer and his whole family, except his youngest son, were taken captive, and carried to Canada. Mr. Sawyer and his children were set free, in consequence of having built a saw-mill on the river Chamblee, (or Sorel,) and instructed the inhabitants in the management of it. This was the first saw-mill, ever erected in Canada; nor was there, at that time, in the Province a single person, who had sufficient skill either to build, or to manage, such a structure. The Indians had determined to sacrifice Mr. Sawyer; and refused to release him, notwithstanding he was demanded of them by the Governour. In the pursuit of this design they tied him to a stake; and gathered around him such combustibles, as were fitted to consume him in a gradual and most excruciating manner. A French priest, sent, it would seem, by the Governour, suddenly came upon them; and holding out a key, which he informed them would unlock the door of purgatory, declared to them, that, unless they instantly released Mr.

Sawyer, he would open that terrible place, and consign the whole body of them to its torments. Overwhelmed by this alarming denunciation, the Indians gave up their prisoner. It cannot be denied, therefore, that the belief of purgatory has, in one instance, been beneficial to man.

In 1707, and 1710, the Savages renewed their incursions ; and did some mischief to the people of Lancaster. These were, however, their last sufferings from this source.

Lancaster includes one Congregation. In 1790, it contained 214 houses, and 1,460 inhabitants ; in 1800, 230 houses and 1,584 inhabitants ; and, in 1810, 1,694.

Sterling, the next township in this direction, was formerly included within the bounds of Lancaster. Its surface is hilly, and rough. Hence it continued to be a forest until a late period. Like other modern settlements, it has had no share in Indian depredations. Sterling was the residence of Sholan, the upright sachem of the Nashuas.

The soil of Sterling is rich, moist, and of course excellent grazing ground. The inhabitants are substantial farmers, who have skilfully, and industriously, availed themselves of their advantages. There is a small village around the church, containing thirty or forty decent houses.

Sterling was incorporated as a parish in 1748, and as a township in 1781. This name was given to it in honour of Lord Sterling. It includes one Congregation. The number of its inhabitants, in 1790, was 1,428, and of its houses 209 ; of its inhabitants, in 1800, 1,614, of the houses, 234 ; in 1810, of its inhabitants 1,472.

Princeton, another rich grazing township, borders upon sterling at the South-West. The surface is high. The Church, and a considerable number of houses, stand on a hill ; which the Hon. James Winthrop determined to be more than 1,200 feet above the level of the ocean. From this ground the prospect is very extensive. The Blue Hills in Milton, and the waters of Boston harbour, distant fifty miles, can both be seen here in a clear day. This hill is the base of the mountain, called Watchuset ; a single

eminence, of an obtuse, conical figure, standing about two miles North of the church. The height of this mountain, as determined by the same gentleman, is 3,012 feet above the level of the ocean. It is visible throughout a great part of this State, and in many places in the neighbouring States.

The Church in Princeton is a handsome building, but profusely ornamented. The houses of the inhabitants, and the appearance of their farms, are sufficient indications of prosperity; and the people are distinguished for industry, sobriety, and sound morals.

The Rev. Thomas Prince, formerly one of the ministers of the old South Church in Boston, was the owner of a large tract of land in this township; which from him derived its name. Mr. Gill, for some time Lieutenant-Governour of Massachusetts, married the only daughter of this gentleman; and after her decease, the family estate came into his hands. On that part of it, which lies in Princeton, he built a house, which, connected with its appurtenances, is more splendid than any other in the interior of the State.

Princeton was originally a part of Rutland; and was incorporated in 1759. In 1790, it contained 144 houses and 1,016 inhabitants; in 1800, 148 houses and 1,021 inhabitants; and, in 1810, 1,062.

We left the country road for the sake of seeing the seat of Mr. Gill. To shorten our way from this spot, we took a by-path, which, we were told, would conduct us directly to Rutland. In this part of our course, by following directions imperfectly given, and doubtfully understood, we came very near being lost for the night. After perplexing ourselves for several miles, we reached Rutland before nine; but found much less agreeable fare in our inn, than we had met with at Groton the preceding evening.

Saturday, October 14th, we left our disagreeable accommodations early; and rode through the skirts of Oakham and New-Braintree, Brookfield, and the skirts of Western, to Brimfield; twenty-nine miles. Our road, through a considerable part of the distance, was stony, ill-repaired, and very disagreeable.

Rutland is a part of the same elevated ground, which has been mentioned. The waters of a single spring in this township, separating into two streams, are emptied, one into the Merrimac, and the other into the Connecticut; and join the ocean at places, one hundred and fifty miles distant from each other. There is, therefore, a continual descent from this spot to Massachusetts Bay, and to the Sound.

The surface, soil, agriculture, and other characteristics of Rutland, are similar to those of Princeton.

This township was purchased of the Indians in 1686; but was not incorporated until 1722. The inhabitants suffered less from Savage depredations, than many of their neighbours. In one of their incursions, in 1723, the Indians killed the Rev. Mr. Willard, who had been a little before chosen the minister of this town, and two sons of a Mr. Stevens; one of the deacons of the church. Two more of his sons they took at the same time, and carried them to Canada. The eldest of these was the intrepid Phineas Stevens, who afterwards commanded at Charlestown; and of whom such honourable mention has been already made in the course of these letters. He was released the following year; and amply retributed to his captors the injuries, which they had done to his family and fellow-citizens.

In the year 1790, Rutland contained 1,072 inhabitants; in 1800, 1,202 inhabitants, and 176 houses; and, in 1810, 1,231 inhabitants.

The country, lying on the road between Rutland and Brookfield, consists of the Eastern skirts of Oakham, and New-Braintree; of which we saw little else, beside a wilderness, variegated here and there with a solitary field, and a miserable cottage. The land was lean, and very stony: and the road for a considerable distance bordered by a swamp; one of the dullest and most forlorn, which I remember. No place could be a fitter spot for an Indian Powaw; and hardly any, less desirable for civilized beings.

Oakham is said to be one of the least, and New-Braintree one of the most fertile, townships in the County of Worcester.

Oakham contained in 1790, 772 ; in 1800, 801 ; in 1810, 848 inhabitants.

New-Braintree contained in 1790, 939 ; in 1800, 875 ; in 1810, 912 inhabitants.

When we entered the North parish of Brookfield, the scene was reversed in a moment. The surface became beautiful ; the agriculture excellent ; the houses good ; and the road bordered every where by ample proofs of prosperity. But of this town I have said every thing, necessary, in a former letter.

In our passage from Brookfield to Brimfield, after crossing a plain, we ascended obliquely, and therefore easily, the Lyme range. It is inhabited by farmers, at little distances, throughout the whole extent. The soil is moderately good ; the houses are indifferent ; and, with some exceptions, the inhabitants exhibit few marks of thrift.

We arrived at Brimfield before sun-set ; and continued there until Monday morning. On Sunday I dined with Mr. Eaton ; lately appointed Consul at Tunis. At his house, also, I spent the evening, and lodged.\* The next morning, October 16th, Mr. S.

\* As this gentleman held a conspicuous station for several years in the service of the United States, it is proper to give a few short notices of him.

General William Eaton, who was born in the year 1764, was a native of Woodstock, in Connecticut. He was educated at Dartmouth College, where he took the degree of A. B. in 1790. While in College, and for some time after he left it, his support was derived from his own exertions, in teaching school. In March 1792 he was appointed a Captain in the army of the United States, and joined his regiment in the Western country the next year ; where he continued until 1797, when he received the appointment of Consul at Tunis. While in this station, he was indefatigable in his efforts to maintain the interests of the United States with the Barbary Powers ; and after much labour he accomplished also the liberation of the crews of six Danish vessels from captivity. In 1803 Mr. Eaton returned to America ; and in the following year left his family and country, and sailed for the coast of Africa, as Navy Agent of the United States to the Barbary Powers.

The most brilliant events in the course of General Eaton's life were his march from Alexandria in Egypt, across the desert of Barca, and the capture of Derne ; in which were displayed the utmost energy, perseverance, resolution, and decision of character. After the conclusion of peace in 1806, he returned to his friends and family at Brimfield in Massachusetts, where he resided chiefly until his death, which took place on the first of June, 1807.—*Pub.*

being detained by business, I left him at Brimfield; and rode to Somers, through Monson, and South Wilbraham : nineteen miles. The road was moderately good.

Brimfield is situated on the Eastern part of the Lyme range ; and is therefore made up of hills and vallies. The centre of the town is a pretty expansion, in the form of the Roman Y ; in the right arm of which spreads a handsome lake, about three-fourths of a mile in length, and one half of a mile in breadth ; furnishing a fine variety of the landscape. Near the junction of the arms with the stem, stands the church ; an ancient structure, small, and ill-repaired, surrounded by a scattered village, consisting of some decent, and more indifferent, houses.

When I passed through this town in 1807, I found it greatly improved in its appearance. The inhabitants had built a new and beautiful church, and a considerable number of new houses. Many others they had also repaired ; and had thus given it an entirely new aspect.

The soil of Brimfield is generally good ; and the country richly watered with springs and brooks. The inhabitants, together with those of Monson and South Wilbraham, have, to a greater extent than I have elsewhere observed, availed themselves of this advantage, by turning these waters upon their meadows and pastures. This, the cheapest, and for meadows the best, of all manures, might with similar advantage be spread over a great part of New-England ; which is generally composed of hills and vallies, and every where watered by a multitude of little streams. The profits, which would result from this easy, cheap, and neat husbandry, can scarcely be calculated. In a country, where almost every farmer can, not only observe and imitate, but reason also, and readily form general truths from particular facts, one would expect that such a practice would be rapidly extended. But improvement, like the heathen goddess of justice, seems every where to be lame, at least in one foot ; and to make a slow and languid progress from place to place.

Brimfield was incorporated in 1731. In 1790, it contained 172 houses and 1,211 inhabitants ; in 1800, 193 houses and 1,384 inhabitants ; and, in 1810, 1,325.

Monson lies on the same range ; and, as a township, differs little from that of Brimfield in soil and cultivation. It was incorporated in 1760. In 1790, it contained 188 houses and 1,331 inhabitants ; in 1800, 223 houses and 1,635 inhabitants ; and, in 1810, 1,674.

South Wilbraham lies also on the same range, and differs little from the places just mentioned, as to its general appearance. It is however a parish only ; the second in the township of Wilbraham. This township was incorporated in 1763. In 1790, it contained 223 houses, and 1,555 inhabitants ; in 1800, 257 houses, and 1,743 inhabitants ; and, in 1810, 1,776.

I reached Somers before dinner. Having dined, I left the inn ; lost my road ; and wandered about with some perplexity a considerable time. At length I arrived at the house of the Rev. Doctor Backus, minister of this town ; where I spent the rest of the day, and a considerable part of the day following.

I am, dear Sir, yours, &c.

## . LETTER XXVII.

County of Hampshire—Rev. Dr. Backus.

*Dear Sir,*

As I am now bidding adieu to the County of Hampshire, I will finish my observations upon this part of the country with a few general remarks.

The County of Hampshire was formed in 1662. It is bounded almost equally by New-Hampshire and Vermont, on the North; by the County of Worcester on the East; by Connecticut on the South; and by Berkshire on the West. It is the largest County in Massachusetts; containing near two thousand square miles, and extending fifty miles in length, from North to South; and about forty in breadth from East to West. It is naturally divided into three great parts; the Connecticut Valley, the Lyme Range on the East, and the range of the Green Mountains on the West. The Valley is of different breadths in different places; but may be assumed as one third of the whole. A greater part of the County lies on the Western, than on the Eastern range.

I have already described the towns on Connecticut River at sufficient length; and stated the soil and appearance of the valley. The lands on the Eastern and Western borders are composed wholly of hills and mountains, and the interjacent valleys. Those on the East are of a moderately good soil, interspersed with rich, and with poor, tracts. Those on the West are generally fertile; and, particularly, are excellent grazing grounds. Several parts of them also yield wheat.

This County furnishes in its various soils abundant crops of all the grains, and other agricultural and hortulan productions, and fruits, found in New-England. There is, perhaps, no species of soil in the world which it does not contain.

The winter on the mountains is severe; the summer mild and cool. Both seasons are warmer in the valley. The winter is here more uniform, and, I think, much more pleasant, than on

the coast. Snow usually commences from the middle to the last of December; and continues from the 10th to the 20th of March. On the mountains it lies commonly from four to six weeks longer than in the valley; and somewhat longer on the Northern side of the range of Mount Tom, where it crosses Connecticut river, than on the Southern. A pleasanter spring is not found any where in this country, than in the third expansion; nor a more serene and beautiful autumn.

There are four considerable rivers, which unite with the Connecticut in this County: Miller's river and Chequapee on the East; Deerfield river and Agawam on the West. The second and fourth run through almost the whole breadth of the State, before their confluence with the Connecticut. Mill streams, brooks, and springs, water every part of it. There is probably no tract of equal extent in the United States, which can boast of a healthier climate, or which is less visited by epidemic or endemic diseases.

The scenery is often remarkably delightful.

The character of the inhabitants of the Valley has been already described. The settlements on the hills were made at a much later period. Brimfield, the oldest of them, was incorporated in 1731; ninety-six years after Springfield, the oldest settlement in the valley. The average proportion amounts to more than one hundred years. In the first half of the eighteenth century, colonists from the North of Ireland planted themselves in Palmer, Westham, Greenwich, and Pelham, in the Eastern, and another at Blandford, and afterwards another still at Colerain, in the Western, division of this County. In all these places a considerable number of their descendants still remain. Except Brimfield, Blandford, Pelham, New-Salem, Granville, Greenwich, and Monson, all the townships on the hills have been incorporated since the year 1760; and the greater part of them since 1770. The towns in the Valley were, in the strict sense, a frontier, until after the reduction of Canada.

The rest of the hill country was settled by emigrants from various parts of New-England. During a short period these people

exhibited that variety of opinions, and manners, which they brought with them : but for many years they have worn the common, sober, orderly character, which has ever prevailed in the Valley. No County in the State has uniformly discovered so firm an adherence to order, and good government ; or a higher regard to learning, morals and religion.

They are also, as a body, industrious and thriving ; and possess that middle state of property, which so long, and so often, has been termed Golden ; because in this situation the best character, and the most sincere enjoyment, are usually found. Few are poor ; and few are rich. Those, who are styled poor in New-England, particularly in the country, are far removed from European poverty, and from that which is found in the large cities on this side of the Atlantic. A poor man, here, has usually a comfortable house ; a little land ; a cow ; swine ; poultry ; a few sheep ; and not unfrequently a horse. Himself and his family are comfortably clad and fed. If they are not ; it is because he or they are sick, lazy, or vicious. Few poor families fail of breakfasting upon tea ; and all of them eat flesh once or twice every day. Their children, also, are taught to read, write, and keep accounts ; and many of them become persons of property and consequence. All of them go, or may go, decently clad, to the house of God. The wealth of this County is, I think, somewhat less than that of Worcester ; partly because more of its settlements are recent ; and partly because the lands are upon an average somewhat inferiour.

Upon the whole, few tracts in this country furnish a more desirable residence, or exhibit a happier state of society, than the County of Hampshire.

In the general census of 1790, the Marshal's deputies who enumerated the inhabitants of Massachusetts proper, numbered not only the persons, but the houses, and the families. It is to be regretted, that the same thing was not done throughout the United States. The whole number of houses in the County of Hampshire was 9,181 ; and the whole number of families, 9,617. The number of families exceeds the number of houses by 436.

Four hundred and thirty-six houses, therefore, contain here two families each ; and 8,745, one family each. The whole number of people in this County, as appears by the same Census, was then 59,681. Of course, the number of persons in a family was very nearly six and a quarter. This number may, I presume, be assumed as the average number throughout New-England, except on the coast,

In the County of Essex, the whole number of houses was 7,644 ; and the whole number of families, 10,883. Of course 3,239 houses contained two families each ; and 4,405 contained one each ; or, what is probably nearer the truth, a number of houses, somewhat less than this, contained, the principal part of them, two ; some of them three ; and some perhaps four, families. The County of Essex contained at this time 57,913 inhabitants. The families in this County then amounted to five and a third persons each. For this difference between Hampshire and Essex I am unable to account ; particularly, as the commercial towns in this County, Newburyport, Gloucester, Salem, Marblehead, and Beverly, hold, in this respect, the same proportion, as the rest of the County. The number of houses in these five towns was 3,257 and the number of families 5,079. 1,822 houses, therefore, in these towns contained two families each ; and 1,435, one each : i. e. with the exception made above.

In Boston, at the same time, there were 2,376 houses, 3,343 families, and 18,038 inhabitants. In Boston, therefore, the number of families exceeds the number of houses by 967. Of the 3,343 families in this town, 1,934 occupy 967 houses, or less ; and 1,409 houses contain only one family each. The number of persons in a family in Boston is five and a third, very nearly. To bring these computations nearer to exactness,

	Houses.	Families.	Excess.	No. of persons in a family.
Hampshire contains	- 9,181	- 9,617	- 436	- $6\frac{1}{4}$
Essex do.	- 7,644	- 10,883	- 3,239	- $5\frac{1}{3}$
The five towns, do.	- 3,257	- 5,079	- 1,822	- $5\frac{1}{3}$
Boston do.	- 2,376	- 3,343	- 967	- $5\frac{1}{3}$

	Persons.	Persons inhabiting houses containing more than one family.	No. of persons in each house, nearly.
Hampshire contains	- 59,681	- 2,974	- 6½
Essex, do.	- 57,913	- 16,263	- 7½
Five towns, do.	- 27,026	- 9,711	- 8½
Boston, do.	- 18,038	- 5,132	- 7½

From this statement you will see, that a material difference exists in New-England between the inland country, and the coast. As there are in the County of Hampshire only 436 families out of 9,617, who are unprovided with separate habitations; and as there are few houses taken upon lease in this County, you will perceive, that almost all the families, here, live in their own houses. A considerable proportion of the instances, in which two families live in one house, is made up of those, in which a new married son lives in the same house with his parents during a short period, while he is providing a house for himself. The number of poor families therefore, which are without habitations of their own, must be reduced much below 436; probably, half at least; and more probably, two thirds. It is thus evident, that almost all the inhabitants of this County are independent, in this high sense; that they live in houses, and on lands, which are their own, and which they hold in fee simple.

It is further evident from this statement, that the number of persons in a family, in the County of Hampshire, exceeds that in the other places specified ½; or almost one person. The number of servants in the commercial towns is undoubtedly much greater than in the interior. The number of persons in a family therefore, exclusively of servants, must bear a still less proportion. This difference in the commercial towns may perhaps be estimated at one and a half in the whole. But as the servants are in many instances taken from poor families, included within the numbers specified, and by no means universally from the interior, a deduction must be made from this proportion: how great, it is impossible for me to determine. Still, from these premises, indefinite as they are, it may, I think, be safely concluded, that

marriages are more universal in the County of Hampshire, and in the interior at large, than on the coast. To celibacy therefore, as one cause, and to greater mortality among children, as another, must this difference be imputed. From these data, also, it is easily seen, that commerce, and the unequal division of property which is the consequence of it, lessen the ability of a large proportion of the community to provide habitations for their offspring.

The whole number of houses, and families, in Massachusetts, as returned in the census specified, was

	Houses.	Families.	Excess.
In Suffolk, -	6,355	8,038	1,683
Essex, -	7,644	10,883	3,239
Middlesex, -	5,998	7,580	1,582
Hampshire, -	9,181	9,617	436
Plymouth, -	4,240	5,173	933
Bristol, -	4,514	5,541	1,027
Barnstable, -	2,343	2,889	546
Dukes, and Nantucket, }	1,013	1,430	417
Worcester, -	8,613	9,729	1,116
Berkshire, -	4,476	4,899	423
Total.	54,377	65,779	11,402

The amount of the number of persons in each family was 5.91; in the County of Hampshire, 6.50; in Essex, 7.50; in Berkshire, 6.2; in Worcester, 5.9; in Boston, 7.33; and in the five towns, 8.33. These may serve as specimens, by which to estimate the several parts of New-England, and probably of the whole American Republic; since they involve every degree, and mode, of population.

According to this estimate, the whole number of families in New-England, in the year 1790, was 169,341; in 1800, 208,986; and, in 1810, 249,488.

The number of houses in Massachusetts was, in 1790, 54,377; and the whole number of houses in New-England, estimated from

this number, was in 1790, 144,224; in 1800, 176,159; and, in 1810, 212,482.

In a compound estimate of the number of houses in New-England, formed on the census of the State of Massachusetts and that of the County of Hampshire, the whole number of houses in New-England may be estimated, in 1790, at 148,000; in 1800, at 181,000; and, in 1810, at 221,000. As the whole interior country of New-England, and a great part of the coast, in the manner of population strongly resembles the County of Hampshire; this estimate, which I have intentionally made in round numbers, may be considered as very near the truth. If it be admitted; 40,000 houses have been built in this country within ten years, preceding 1811; beside those, which have been erected in the places of such, as have been burnt, or taken down. Almost all these buildings are decent: a great number of them neat; and a considerable portion of them handsome.

Since these journeys were made, this noble country, after having existed as a fine Doric column of industry, good order, morals, learning, and religion, in Massachusetts for more than a century was by an unwise Legislature broken into three parts. Of its ruins were formed the three Counties, of Franklin on the North, Hampshire in the Middle, and Hampden on the South; each of them extending through the original breadth of the County of Hampshire. One political purpose, intended to be accomplished by this disruption, was to destroy the firm order, and sound principles, of the inhabitants. How far the plan will succeed time alone can discover. From analogy it may be concluded, or, at least rationally feared, that the inhabitants will lose some part of their elevation of character. Little Counties almost of course have little officers, and little concerns: and the existence of these is but too commonly followed by a contraction of views, a diminution of measures, a destruction of influence, and a deterioration of character.\*

\* The population of these Counties was as follows:

	1810.	1820.
Hampshire, - - -	24,553	28,487
Franklin, - - -	27,301	29,268
Hampden, - - -	24,421	28,021— <i>Pub.</i>

At Somers I continued till the afternoon of Tuesday 17th; when being rejoined by Mr. S. we proceeded through a corner of Ellington, and the townships of East-Windsor and East Hartford, to Hartford: twenty miles. The road, after leaving South Wilbraham, enters upon the great plain, which I have mentioned as the principal part of the second Expansion, on the Eastern side of Connecticut river. Most of it is good; and with moderate labour might be made excellent.

Partly on this plain and partly on the Western side of the Lyme Range, lies the township of Somers. The plain, is here, and in the towns South of it, a warm, kind soil; and when dressed with gypsum, it amply repays the labours of the husbandman. The hills are generally fertile; but in some instances hard and stony. The inhabitants are farmers; the appearance of whose houses, and fields, proves them to be in easy circumstances. They form one Congregation; amounting, in 1756, to 900 inhabitants; in 1774, to 1,027; Blacks 3; in 1790, to 1,125; and in 1800, to 1354; and, in 1810, to 1,210.

Doctor Backus, when I was at his house, had for sometime been struggling with a decaying constitution; and has since left the world. From me he well merits as a class-mate, and friend, as a man of learning and piety, and especially as an eminent Minister of the Gospel, a particular character.

He was born at Norwich, November 5th, 1749; and was bereft of both his parents in his childhood; and was thus cast on the care and direction of his friends. The love of knowledge which distinguished him when a man, he strongly exhibited when a child. This determined his friends to give him a liberal education, and to make up the deficiency of his patrimony for this purpose by their own contributions. Under their auspices he entered Yale College in 1765; and received the degree of A. B. in 1769, and that of A. M. in 1772. The Rev. Dr. Hart of Preston, instructed him in Theology. In 1773, he began to preach; and was immediately invited to Somers. When he arrived here, he found the people distracted with feuds, and disorder. A man, named Samuel Ely, afterward the great fomentor of discontent, confusion, and sedition, in

Massachusetts, had, some years before, offered himself as a preacher to this Congregation, and obtained a kind of settlement among them. Ely was an unlicensed and disorderly preacher; and could not obtain an ordination. His character even at that time, although, less known and probably less corrupted, than it was afterwards, was yet so stained, as to render it impossible for him to enter the Ministry. But he possessed the spirit, and, so far as his slender abilities would permit, the arts, of a demagogue in an unusual degree. He was voluble, vehement in address, bold, persevering, active, brazen-faced in wickedness, and under the accusation, and proof, of his crimes would still wear a face of serenity, and make strong professions of piety. At the same time he declared himself, every where, the friend of the suffering and oppressed, and the champion of violated rights. Wherever he went, he industriously awakened the jealousy of the humble, and ignorant, against all men of superiour reputation, as haughty insolent and oppressive. Jealousy he knew to be, among human passions, the most easily and certainly kindled. Both his character, and his circumstances, were in his own view deplorable; and he felt therefore, that he had nothing to lose, beside his neck: a loss too uncommon in this State, to be seriously dreaded, except in the case of murder. Of course, he undauntedly applied himself to any wickedness, which promised him either consequence, or bread.

The Association of New-London County had, some years before, when his character was very imperfectly known, or even suspected, licensed him to preach; rashly, in my view at the time, and in that of many others, notwithstanding all his labour, and care, to pass for a man of piety. The issue ought to be a perpetual warning to all other associations to license *suddenly no man*. His license either ceased, or was taken away, at the end of six months; and was never renewed.

When he offered himself to the people of Somers, they had for some time been divided, and contentious. Somers, therefore, was a theatre, exactly suited to his wishes. In spite of the opinion, and remonstrances, of the cool and prudent, inhabitants, the

majority, after hearing him a while, determined that he should be their Minister. As no real Minister would be concerned in ordaining him; the people concluded to ordain him themselves. This work they performed in their own way; and Ely was established in the desk.

But he could not conceal his character for any length of time, even from his abettors. Their troubles were increased, instead of being lessened: and at length compelled them, after some years, to call a Council of the neighbouring Ministers and Churches, to quiet their difficulties. This Council prevailed upon Ely to submit himself to an examination of his moral and literary character, as a Candidate, in the customary manner. They accordingly examined him in learning, and science; and found and pronounced him to be wholly unqualified, even in this respect, to be a preacher. Of course, he was compelled to leave Somers.

From Somers he removed into an obscure township in the County of Hampshire; and, finding the inhabitants burdened by the calamities of the war, and complaining of their sufferings, he applied himself, with but too much success, to excite trouble and insurrection. He was here a stranger to the people at large; and as such, was listened to without suspicion. He soon forced himself into the hands of the law; and was confined in prison; and at length became so odious, as to be incapable even of doing harm. The remainder of his life was a tissue, woven of nothing but guilt and infamy.

Dr. Backus came to Somers soon after Ely left the desk. The people, whom he found in the miserable situation already described, he gradually brought back to order and peace. In August 1774 he was ordained their Minister. No Congregation has, perhaps, more clearly shewn the beneficent influence of the Evangelical Ministry, than his. From the time of his settlement to this day, they have been a people eminently happy. To his preaching, counsels, and example, they themselves impute this wonderful change.

Dr. Backus was chosen Professor of Divinity in Dartmouth College; and afterwards in Yale College; but he declined the

invitation in both cases. Few men in the world are probably better qualified for this office. His modes of thinking, communication, and life, were all peculiarly suited to the Theological chair. Clear and discriminating in his conceptions; affectionate; distinguished for ease and precision, in his language; and unusually exemplary, and amiable, in his deportment; he invited by his instructions attention, and research; and left the strongest impressions of their truth, wisdom, and importance. Few instructors have probably been better beloved, or remembered with more honour, by their pupils. Of these it is said, he educated between forty and fifty for the desk; every one of whom, if living, will attest to the justice of these observations.

As a preacher, Doctor Backus was calm, affectionate, solemn, interesting, and persuasive. His style and elocution were artless, manly, and pleasing. His sentiments were in a high degree evangelical, and without a suspicion, seated in the heart. His doctrines, and life, were such as become, and evince, godliness. His reputation was, of course, such, as placed him in the first class of divines. His temper, originally ardent, he had from early youth laboriously reduced under the controul of judgment: and after he became a man, almost the only appearance which it ever made, was in the earnestness, which it lent to his addresses, and in the kindness, with which it invested all his affections.

I have not known a wiser man. Prudence strongly marked almost every thing, which he said, or did. He was excessive in nothing; firm in every thing; pre-eminently upright and benevolent; always taking the direction of sound common sense; superiour to the love of innovation, and to the rejection of it, when plainly recommended by truth and utility. As he was *wise*; so there is reason to believe, that he turned no small number of his people to righteousness: four considerable revivals of Religion have taken place in Somers during his Ministry. The confidence of his people, and their affection to him, regularly increased until his death. The disease, of which he died, was a pulmonary consumption. He languished long, and under many distresses of body: but his peace of mind brightened to the end. The last words, which he

uttered, and which he uttered in a whisper, after he had become unable to speak with a louder voice, were "Glory to God in the highest; and on earth peace: good-will towards men." Who would not rather have been Doctor Backus than Hume, or Voltaire; than Frederic II, or Napoleon?

The reasons of his refusal to accept the Professorship of divinity in Yale College, he did not think proper to communicate. The principal one is not improbably found in the following anecdote.

A gentleman, who was a Representative from Somers in the Legislature, sitting at New-Haven while Doctor Backus was deliberating on this subject, was urged by one of his friends to use his influence in persuading the people of Somers to unite with their Minister in calling an Ecclesiastical Council, which should decide on the propriety, or impropriety, of his acceptance. He replied, "You solicit me in vain. If Doctor Backus resolves to leave us, we cannot help it. But we will never consent to call a Council for the purpose of determining on our own destruction. If he leaves us, we are undone, and no people can be reasonably expected, or desired, voluntarily to take measures to accomplish their own ruin."

Doctor Backus had but one child; a son; who promised to be a blessing both to his parents and to mankind. He died while he was a member of Yale College, March 16th, 1794, in the 17th year of his age. This affliction both his parents sustained with a most edifying mixture of tenderness, fortitude, and resignation.

I am, Sir, yours, &c.

## LETTER XXVIII.

Ellington—East-Windsor—Fragment of Indian History—East-Hartford.

*Dear Sir,*

ELLINGTON, a corner of which we crossed before we entered East-Windsor, is, like Somers, situated partly on the plain, and partly on the hills. A few years since, no township in the County of Hartford, in which it was then included, was in lower estimation. Its soil was considered as lean; its agriculture was wretched; and the circumstances of its inhabitants were generally very humble. A respectable farmer from the Eastern part of the State came into it, and purchased a farm of considerable extent. On this tract the former proprietor, although neither idle, vicious, nor in debt, had been barely able to live. The present owner, by a skilful and vigorous cultivation of the same land, has become rich. His neighbours have extensively followed this encouraging and beneficial example; and are becoming wealthy also. A single man has thus changed the circumstances of a community; and enabled them, instead of obtaining a bare sustenance, to furnish a rich supply of valuable productions for the market. The buildings have been improved with the agriculture: and the inhabitants have risen not a little in their general character.

A few years since the people of Ellington built a new church. The Rev. Mr. B. their minister, was standing on the top of the tower, while it was a mere frame, and fell by accident to the ground. The distance was about seventy feet: yet he was taken up alive; and, although lame by the fracture of one of his limbs, possesses sufficient health to perform the customary duties of his office.

Ellington, in 1790, contained 1,056 inhabitants; in 1800, 1,209; and, in 1810, 1,344.

East-Windsor is a township, bordering on the Connecticut; having Enfield on the North, and East-Hartford on the South. It is composed of the great plain, already mentioned, and a collection of rich intervals, bordering on the river, and Scantic, one of its trib-

utary streams. The plain was formerly supposed to be of little value, except for its wood. Within a few years past it has been extensively dressed with gypsum; and yields large crops of wheat, grass, and other products of the climate. The inhabitants of the Northern parish, lying along the Scantic, and taking its name from that stream, have, by the cultivation of these lands, greatly increased their property.

The settlements in this township are distributed into three divisions: the Town, or Street, which is a continued village, built on the plain, near the intervals of the Connecticut, from the Northern to the Southern boundary of the township: Warehouse Point, a village containing forty or fifty houses, built on the margin of the river at the Northern boundary, where the sloop navigation is terminated by Enfield falls: and a collection of farms, lying along the Scantic, and on the plain. The houses in the Street, which is the original settlement, are in many instances old, and indifferently repaired, and in many others, good. One or two are elegant, and even splendid. Warehouse Point is a cluster of traders, and mechanics, collected together within a few years. The houses on the plain are good farmers' dwellings.

In this township there is a valuable quarry of free-stone, extensively used in building throughout this region. The texture is fine, and the colour beautiful.

The people of East-Windsor have ever been distinguished for a steady, industrious character, and orderly habits; and are unquestionably a valuable collection of citizens.

A Mr. Bartlett, a respectable farmer in the parish of Scantic, has obtained a patent for a new species of aqueduct,\* invented by him, and carried into the most successful execution on his own farm. It consists of short tubes, formed of strong clay, intensely baked, and thoroughly glazed. These are nicely inserted into one another successively, until the proposed length is completed. To unite them perfectly, he has devised a cheap cement, which renders them tight, and promises to resist, effectually, the influence of time. When formed of the clay, which is employed to

\* At least unknown in this country.

make what is generally called stone-ware, they appear to be literally incapable of decay; and conduct water without the least contamination. They can, also, be afforded on moderate terms. Thus they unite all the advantages of wooden, leaden, and iron, conduits; and are free from all their disadvantages. This invention may be pronounced an interesting improvement in human affairs; and will probably become a substitute for every other mode of conveying water beneath the surface.

The aborigines of East-Windsor were called *Podunk* Indians, from a mill-stream of that name in this township. It is known, that they were once invaded by the *Mohawks*; but met them in such numbers, as to disappoint their enterprise, and induce them to retire without having accomplished any thing of importance. Still, they appear to have lived in continual fear of this people; as will be sufficiently evident from the following fragment of history.

In the year 1656, a *Podunk* Indian, named *Weaseapano*, murdered a *Sachem*, who lived near *Mattabeseck*; now *Middletown*. *Seaquassin*, the existing *Sachem* of the tribe, complained of the outrage to the magistracy of *Connecticut*; and said, that the *Podunk* Indians entertained the murderer, and protected him from the merited punishment. *Seaquassin* at the same time engaged *Uncas* in his cause; who also complained, that *Tontonimo* enticed away many of his men; and protected an Indian, who had murdered a *Mohegan*. Upon these complaints, the magistrates summoned the parties before them. *Seaquassin* and *Uncas*, after observing that the murderer was a mean fellow, and that the man murdered was a great *Sachem*, insisted, that ten men, friends of *Weaseapano*, should be delivered up, to be put to death, as a satisfaction for the crime. *Tontonimo* insisted, that the satisfaction demanded was excessive; particularly, as the murdered *Sachem* had killed *Weaseapano's* uncle. The Governour endeavoured to convince the complainants, that the demand was excessive; observing, that the English in cases of murder, punished only the principal, and such as were accessory to the crime.

Tontonimo then proposed to make satisfaction by the payment of wampum ; but it was refused. They fell, however, in their demands to six men, instead of ten. This proposition was rejected by Tontonimo. The magistrates then urged him to deliver up the murderer. This, he promised to do. But, while the subject was in agitation, he privately withdrew from the Court, with the rest of the Podunk Sachems ; and retired to the fortress, belonging to his nation. Both the magistrates, and the complainants, were offended at this behaviour of Tontonimo. However, the magistrates appointed a Committee, to persuade the Indians to continue at peace with each other. At their solicitation, Uncas at length consented to accept the murderer ; and promised to be satisfied, if he should be delivered up ; but the Podunk Indians told the English, that they could not comply with this condition ; because the friends of Weasepano were numerous, and powerful, and would not agree to the proposal. The Governour then addressed them in form ; urging them to continue in peace, and endeavouring to persuade the complainants to accept of wampum. This they again refused ; and withdrew ; after it had been agreed on all hands, that the English should not take any part in the controversy ; and after the Indians had promised, that they would not injure either the persons, or possessions, of the English on either side of the river.

Soon after, Uncas assembled an army for the purpose of avenging his wrongs. But, being met near Hoccanum river, by an equal number of the Podunks, and considering the issue of a battle as doubtful, he prudently retired after having sent a message to Tontonimo, in which he declared, that, if the Podunk Sachem persisted in withholding the murderer from justice, he would send to the Mohawks, to come and destroy both him and his people.

Not long after, the crafty Moheagan accomplished his purpose in the following manner. He sent a trusty warrior, furnished with some Mohawk weapons, to Podunk ; directing him to set fire in the night to a house, near the fort, and then to leave the weapons on the ground in the vicinity, and immediately return.

The warrior executed his commission. When the Podunks came in the morning to examine the ruins, they found the weapons; and, knowing them to belong to the Mohawks, were so alarmed with the apprehension, that Uncas was about to execute his threat, that they delivered up the murderer, and sued for peace.

East-Windsor contains two parishes; the inhabitants of which including those of Ellington, amounted, in 1774, to 2,999; blacks 38. In 1799, those of East-Windsor, only, amounted to 2,600; in 1800, to 2,766; and, in 1810, to 3,081.

East-Hartford resembles East-Windsor in location, soil, agriculture, improvements, and buildings. Its intervals on Connecticut river are larger. The town consists principally of a street, running from the Southern to the Northern boundary; a continued village throughout the whole distance. Indeed, the whole road, from the Southern limit of Glastenbury to the Northern limit of Long-Meadow, a distance of about thirty miles, may be regarded as one village: the distance between the houses being nowhere considerable.

An excellent mill-stream, called Hoccanum River, crosses this township obliquely from the Lyme range; and furnishes a great number of convenient mill-seats. On this stream there is an unusual number of works, erected for various manufacturing purposes. Powder, paper, glass, &c. are among the manufactures, carried on here with spirit, and success. I am informed, that these and various other manufactures, attempted here, have yielded a handsome profit to those who are engaged in them.

Both this and the preceding town are among the oldest in Connecticut; and the inhabitants of both have ever sustained a respectable character.

East-Hartford was formerly a part of Hartford. In 1790, it contained 3,016 inhabitants; in 1800, 3,057; and in 1810, 3,240.

The following day we arrived at New-Haven.

I am, Sir, yours, &c.

# JOURNEY TO THE CANADA LINE.

---

## LETTER I.

New Road from New-Haven to Hartford—Whitney's Cotton Gin, and Manufactory of fire arms—Guilford—Brattleborough—West River.

*Dear Sir,*

TUESDAY, September 20th, 1803, I set out with Messrs. H——, S——, and D——, A. B. of Yale College, and Mr. F——, a member of the Senior Class, on a journey up Connecticut River to the Line, which in the 45th degree of North Latitude divides New-England from Lower Canada. The first day we proceeded to Hartford : thirty-four miles.

In my account of the journey, which I took to the White Mountains in the year 1797, I mentioned that a better road was projected, and had been made, than that, in which Mr. L—— and myself travelled from New-Haven to Hartford. By the direction of the Legislature a straight line was run between these towns; and the following year, Commissioners were appointed to lay out the road, with a continual reference to this line. The design was followed too scrupulously, perhaps, for the convenience of travellers. In one place, only, does it diverge to the distance of one hundred and nine rods. Had a less rigid attention been given to the scheme of making a straight road, several disagreeable hills might have been avoided, much of the expense prevented, and the distance very little increased. As it is, it is one of the best roads in the State. It also presents a greater variety, and a more uniform succession, of fine views than most others of the same extent in this country. It shortens the distance between New-Haven and Hartford about five miles. The first fourteen miles

it runs on the West side of Wallingford river; thence through Meriden, and along the Western margin of the Middletown range to Worthington; and thence through the parishes of New-Britain and Newington, and a corner of Wethersfield, to Hartford. For this improvement the public are principally indebted to the Hon. James Hillhouse.

This is the road, which we now took. The first object in our journey, deserving the attention of a traveller, is a manufactory of fire-arms, erected about two miles from New-Haven, by Eli Whitney, Esq. This gentleman was born at Westborough in Massachusetts, and was educated at Yale College. Soon after he had received the degree of A. B. in that Seminary, he went to Georgia with views and intentions wholly diverse from those which afterwards engaged his attention.

He had been but a short time in Georgia, before he had an opportunity of conversing with several respectable planters of that State, and of frequently hearing their conversations with each other. In these casual meetings, inquiries, relating to the most productive kinds of crops, were topics, upon which the planters dwelt with peculiar interest. Here he learned, that no crop then produced in Georgia, yielded much profit; that several attempts had been made to raise a species of *Cotton*, known by the name of *Green Seed Cotton*; but which had never been cultivated, for the purposes of commerce in any country. The planters informed him, that the shrub, which yielded this cotton, grew well in Georgia, and was abundantly productive; but that its fibres adhered so closely to the seed, as to be detached with great difficulty; that no convenient and efficacious method of separating them had hitherto been discovered and that, if this difficulty could be surmounted, this cotton would be a more profitable crop than any, which had hitherto been introduced into the Southern section of the United States. On these and other occasions the wish was often and ardently expressed, that a machine might be invented for this purpose; and the declaration made, that such an invention would ensure an independent fortune to its author.

A mind always awake and attentive to every thing passing before it, could not easily suffer an object, on which so much stress was laid, to escape without examination. Mr. Whitney immediately set himself to investigate the structure of this product, and to devise means for rendering it valuable to mankind. After pursuing his inquiries during a few months, he contrived and executed, under the patronage of Phineas Miller, Esq. a respectable planter in Georgia, a machine, entirely new, both in its form and principle; which effectually answered the purpose; and the utility of which has greatly exceeded every anticipation.

For this machine he obtained a patent: but, like many other benefactors of the public, had the mortification to see himself plundered of the benefits of his invention. The law, originally made to protect this species of property, was imperfect: and almost all the individuals, composing the courts, and juries, of Georgia, were personally interested. The machine was converted into a political engine: and demagogues rose into popularity by unfounded and vociferous, declamation against this species of right, and the law which was made for its protection.

To give a detailed account of the expedients, to which recourse was had, in order to defeat the claims of Mr. Whitney, would carry me beyond my limits. Suffice it to observe, that thirteen years of his patent term had expired, during which more than sixty suits were instituted in that State, before any decision on the *merits* of his claim was obtained; and that, although every such decision has been in his favour, the expences of prosecution have far exceeded what he has received from the citizens of Georgia.

The Legislature of South-Carolina voted him \$50,000 as a purchase of the patent right for that State. The succeeding Legislature rescinded the vote; and ordered a suit to be instituted against him for the recovery of \$20,000, of the purchase-money, which had been paid. To the honour of many citizens of that State it ought to be observed, that this act was regarded by them with the detestation, which it merited; and that to their zealous and honourable exertions it was owing, that Mr. Whitney, after much delay, and expense, was enabled to obtain a re-establishment of the contract.

The Legislature of North-Carolina laid and collected a tax on such of his Cotton Machines as were then in use in that State and after deducting the expense of collection, paid over the avails of the tax to Mr. Whitney. Though the cultivation of cotton, in the State of North-Carolina, was then quite limited and the amount which he received was small, yet the remuneration from that State, was considered by him, as more liberal, in proportion to the use of his machines there, than the amount he received from South-Carolina.

The only method of separating the fibres of this cotton from the seed, so as to leave it fit for spinning, which was known, anterior to this discovery, was to pick out the seeds, one by one, with the fingers; and it was thought a proof of great dexterity, skill and industry for one person, to clean one pound in a day. With the aid of this machine, a single person will, in one day, clean with ease a thousand pounds. As a labour-saving machine, therefore, it has, perhaps, never been rivalled.

Before the invention of this machine, it will be remembered, that this species of cotton was not known in commerce: the expence of cleaning it being such, as absolutely to forbid its cultivation for market. If we add to these considerations the immense increase of wealth, derived from it to the Southern States, the incomprehensible increase of cheap, comfortable, and even handsome clothing, especially for the poor and middle classes of mankind; the value of this invention can hardly be exaggerated, or its benefits too highly appreciated.\*

\*From the returns made to the Treasury Department, it appears that in the year ending the 30th September 1807, this species of cotton, since denominated "Short Staple," "Upland," and "Bowed Cotton," was exported from the United States, to the amount of more than 55,000,000 of pounds. It is estimated that the quantity manufactured in the United States during the same period, must have been at least 5,000,000 more: making an aggregate of 60,000,000 of pounds. It was then valued at twenty cents per pound; and was therefore worth twelve millions of dollars.†

† It can be shewn from authentic documents that more than one hundred millions of pounds of this kind of cotton are now annually produced in the United States; all of which would be of no value without Mr. Whitney's invention.—*Pub.*

After Mr. Whitney had pursued the business of making machines of this description for several years, but antecedently to many of the facts which have been just related, he entered into a contract with the National Government to manufacture for their use 10,000 muskets.

For the purpose of executing this contract he erected the manufactory, which I have mentioned. It is situated at the head of tide-water, upon a stream called Mill-river; which furnishes at all times an ample supply of water, with a fall at this place, sufficient to give motion to the necessary machinery. The river is navigable to this spot for scows, carrying from twenty to thirty tons. No position for a manufactory could be better. From the bleak winds of winter it is completely sheltered by the surrounding hills: to the delightful breezes of summer it is perfectly opened by the valley, through which the river flows. No place, perhaps, is more healthy: few are more romantic.

In this manufactory muskets are made in a manner, which I believe to be singular. In forming the various parts of this instrument, machinery, moved by water, and remarkably adapted in every instance to the purpose in view, is employed for hammering, cutting, turning, perforating, grinding, polishing, &c. &c.

The proportion, and relative position, of the several parts of the locks are so exactly alike; and the screws, springs, and other limbs, are made so similar; that they may be transferred from one lock and adjusted to another without any material alteration. This desirable object, Mr. Whitney has accomplished by an apparatus, which is simple, peculiar, and eminently ingenious. By an application of the same principles a much greater uniformity has also been given to every part of the muskets, made in this manufactory, than can be found in those, which are fabricated at any other. The advantages, which in actual service result from this uniformity, are too obvious to need an explanation.

This establishment was undertaken by Mr. Whitney without the least experience in manufacturing fire-arms. All his workmen, also, who were employed in carrying it into operation, were absolutely unskilled in the business: not one of them having ev-

er wrought in any branch of it, antecedently to their having been instructed by him.

In these circumstances Mr. Whitney was constrained to adopt methods of his own, and, as skilful artists could not be obtained, to devise a system in which the more exact operations of his machinery might supply the want of experience in the workmen. Hence modes of working iron, and other metals, and materials, have been invented by him,, which are new and peculiar ; and which experience has shewn to be exceedingly useful.\*

After leaving this manufactory, and advancing about three miles, we were presented with a delightful prospect over the valley of the Quinipiac. This river runs through a large expansion of meadows with a succession of meanders, peculiarly elegant ; and is bordered throughout by a lively verdure. Beyond it, on the East, and North, rise a succession of hills, ornamented with forests, fields, and farm-houses, bounded at the distance of near twenty miles by the Middletown mountains. Mount Lamentation rises nobly at about the same distance with a fine summit, directly in the road. The village of North-Haven, with its white church in the centre, adds at the distance of three miles a handsome variety to the landscape, otherwise too solitary.

At the distance of ten miles the Quinipiac winds in a sprightly manner at the road side ; and with its cheerful intervals forms a very pleasant contrast to the rude hills, bordering the road on the West. Here, also, in several places the town of Wallingford, seen with the utmost advantage on the summit of a beautiful ridge, furnishes a pleasant addition to the prospect.

From the hills in Meriden a fine retrospective view is taken of the valley of Quinipiac, terminated by the mountains of New-Haven. Here also, as I have elsewhere observed, is a magnificent prospect of the blue mountains in Southington on the left, and of the Middletown range on the right. At Berlin the traveller is presented with many views of the fine scenery formerly

\* Mr. Whitney's system and improvements in manufacturing fire arms have since been introduced into the National Armories at Springfield and at Harpers Ferry.—*Pub.*

described in the account of that township. After crossing the little ridge called Newington mountain, the eye is soon feasted with a rich prospect of the Connecticut valley, with all its interesting appendages.

New-Britain, the Northern parish of Berlin, and Newington, are beautiful collections of farms.

On Wednesday the 21st, we proceeded to Northampton; and on Thursday, to Hatfield. Friday we reached Brattleborough; having passed through Whately, Deerfield, Greenfield, Bernardston, and Guilford: the whole distance from Northampton being forty-one miles.

Guilford is the first township in Vermont, on this road, commencing at its Southern boundary. At the South East corner of the State is the small township of Vernon; originally the Western part of Hinsdale, and lying between Guilford and Connecticut River. Vernon was the first spot in this State, settled by English inhabitants; who were drawn hither by some valuable intervals. Here formerly stood Fort Dummer, built for the purpose of checking savage invasion, and once of considerable importance to the Colonists in its neighbourhood. It was erected in the year 1743, under the direction of Colonel Dwight of Northampton, by order of the Legislature of Massachusetts Bay, within whose Charter it was supposed to be included. The remains of this fort I formerly saw; they probably exist at the present time. This small township is a pleasant spot, and contained in the year 1790, 482 inhabitants; in 1800, 480; and in 1810, 521.

Guilford is generally considered as a good township of grazing land; lying principally on hills considerably elevated; and, is universally inhabited. Our road passed through its Eastern skirts. After it left the old settlements in Bernardston, it entered a narrow valley in the Northern limits of this township, lying between two mountains; that on the East a continuation of the Deerfield ridge. This valley is a romantic spot, several miles in length, and for a considerable distance one third of a mile in breadth. Steep, shaggy eminences ascend upon both sides.

The bottom is a smooth surface, watered throughout by a sprightly stream ; the borders of which are formed by a chain of intervals, covered at this time with the most brilliant verdure. As we passed through it, I could not avoid feeling some regret, that the inhabitants, otherwise pleasantly situated, should never be able to see either the morning or the evening sun, when within less than twenty degrees of the horizon. They were few in number ; and lived in scattered settlements, recently made, and in houses of little value. In the year 1812, having occasion to take the same road again in journeying from Windsor in Vermont to New-Haven, I found this valley converted into a beautiful, well cultivated ground, and ornamented with several good houses. From Greenfield to the Northern end of this valley the road is better than any other within my knowledge. Hence to Brattleborough, through the Eastern skirt of Guilford, it crosses a succession of rough and disagreeable grounds, without any thing in the surrounding country to refresh the eye.

In the year 1790 Guilford contained 2,432 inhabitants : a greater number than there were at that time in any other township, in the State ; in 1800, 2,666 ; and, in 1810, 1,872.

Brattleborough, the next township, was settled not long after Vernon ; and, like it, borders on the river. It has a softer, and handsomer aspect than Guilford ; yet it is uneven, and some of the hills are high, and steep. A little collection of houses, often styled the Village, and sometimes the City, built at the Southern limit of a plain immediately below the mouth of West river, is one of the prettiest objects of the kind, and size, within my recollection. If we did not mistake in counting them, they were now but ten in number ; but with their appendages were remarkably neat.

West river, a considerable tributary stream of the Connecticut, discharges its waters over against the mountain of this name, heretofore mentioned. It rises in the township of Bromley, on the Green Mountain range ; and runs through Londonderry, Jamaica, Townsend, New-fane, Dummerston, and Brattleborough : almost forty miles.

Brattleborough, on the road, has a warm, rather than a rich, soil. The inhabitants are all included within a single congregation;\* and amounted, in 1790, to 1,589; in 1800, to 1,867; and, in 1810, to 1,891.

A good bridge crosses the Connecticut against the city. There are several mills, and other water-works, in this spot, together with a number of mechanics' shops, and stores, which give it a sprightly aspect.

I am, Sir, yours, &c.

\* 1810.

## LETTER II.

Dummerston—Putney—Westminster—Rockingham—Bethlehem—Wentworth Mountains—Hardships endured by the first settlers—Notch of the White Mountains—Jefferson—Fine view of two Cascades.

*Dear Sir,*

On Saturday, September 24th, we set out for Charlestown, through Dummerston, Putney, Westminster, and Rockingham : thirty-two miles. On West river bridge, we saw a noble specimen of the Grand Obscura. Immediately beyond the Connecticut, which lay almost beneath us, rose West river mountain. A mist, ascending from the Connecticut, partially, and in the happiest manner possible, concealed the mountain ; doubled its elevation ; magnified every rock, and tree, which its bosom displayed ; converted the whole into one vast precipice ; and bedimming with an universal confusion all these objects, led the imagination to invest them with a grandeur, still more awful than that, which was presented to the eye.

Dummerston, formerly known by the name of Fulham, is at least so far as we saw it, a rough, unpromising township, lying opposite to Chesterfield. A quarry of slate, one of the only two, I believe, wrought at the time in New-England, lies in the Southern part of this township, and yields slate of a very good quality. That which is valuable, however, is found only in veins. The working of one of these lately yielded, with the labour of a single man in one season, six hundred dollars. A square, i. e. what will cover the same space as one thousand eighteen inch shingles, is sold on the spot, as a workman informed us, for four dollars. The shingles, which would cover this square, are sold at the same place for two dollars, and two and a half.

In the year 1790, Dummerston contained 1,501 inhabitants ; in 1800, 1,703 ; and, in 1810, 1,704.

Putney lies, like Dummerston, on elevated ground ; but exhibits a pleasanter surface along the road. On a stream, which turns

several mills in the neighbourhood of some well-appearing houses, a beautiful winding valley opens towards the West. The acclivities on both sides of the valley are very handsome ; and present a succession of rich farms under good cultivation. Several good houses, and a decent church add to the cheerfulness of the prospect.

Putney, in 1790, contained 1,848 inhabitants ; in 1800, 1,594 ; and, in 1810, 1,607.

Westminster, immediately North of Putney, consists, so far as we saw it, of a succession of undulating ground, less fertile than Putney, and less pleasing to the eye. This is a village, generally well-appearing, built on a single street, parallel to the river. The Southern part of this street is on a plain ; the Northern, on one of the intervals, mentioned in the account of Walpole. From the plain are seen with advantage many of the fine objects, mentioned in that account.

Westminster includes two parishes ; and contained in 1790, 1,601 inhabitants ; in 1800, 1,942 ; and in 1810, 1,925.

Immediately above Westminster lies Rockingham. Of this township we saw very little : the hills approaching so near to the river, as to shut out from our view almost every thing, except their own sudden declivities. Around one of these, which is very steep, the road is so narrow, as to fill travellers with disagreeable apprehensions. It ought to be observed generally, that the townships, through which we passed, are in many instances very imperfectly seen from this road ; and are often rich and flourishing in the interior, when the skirt, on which our journey lay, presents nothing to gratify the eye. Rockingham is such a township. Solitary as its appearance is along the river, the settlements made in it are considerable : for, in 1790, it contained 1,275 inhabitants ; in 1800, 1,684 ; and, in 1810, 1,954.

Rockingham has no minister settled in it, except one, of the Baptist persuasion.

We continued at Charlestown until Monday, the 26th, and then rode to Windsor. The next day we proceeded to Hanover, and thence to Lyme ; and thence on the 28th, through Orford, Pier-

mont, Haverhill, and Bath, to Concord: the distance from Charlestown eighty-two miles.

On Thursday, the 29th, we directed our course from Concord up the Lower Amonoosuck to Rosebrook's: twenty-nine miles.

Seven miles from our inn, and three above the spot where the Lancaster road ascends the mountains of Littleton, we crossed the river by a very difficult ford, just below a place called the Upper Mills. Here we left the valley; and ascended the high hills of Bethlehem. The road through this township lies partly in a forest, and partly amid the settlements. These are recent, few, poor, and planted on a soil, singularly rough and rocky. There is nothing in Bethlehem which merits notice, except the patience, enterprise, and hardihood, of the settlers, which have induced them to venture, and stay, upon so forbidding a spot; a magnificent prospect of the White Mountains; and a splendid collection of other mountains in their neighbourhood, particularly on the South-West. These are entirely separated from the White Mountains by a deep and narrow valley. Among them, one, inferior only to the White Mountains, and Moosehillock, exhibits in its great elevation, elegance of form, and amplitude: a very rare combination of beauty, and grandeur. It is composed of three lofty conical summits, accompanied by four vast, bold, circular sweeps, formed with a grace, to which in objects of this nature I had hitherto been a stranger; and which removed all doubts, in my mind, concerning the practicability of uniting the most exquisite beauty with the most splendid sublimity. To this mountain, hitherto without a name, I have taken the liberty to give the appellation of *Mount Wentworth*; from the respect, which I have ever borne to John Wentworth, Esq. formerly Governour of New-Hampshire. As seen from the hills of Bethlehem, it appears on the right of the White Mountains; as does Pondicherry on the left.

It is hardly necessary to observe, that the beauty of every fine landscape arises in a great measure from a comparison of the several objects, which compose it; and is made up, extensively, of the relations, which they bear to each other. This is emphatical-

ly true of a cluster of mountains. A nobler groupe cannot be imagined than that, which is seen from Bethlehem ; nor one, to which this remark can be applied with more force. Their form, their extent, their height, their position, and all the circumstances of their appearance, are so varied through the several gradations of beauty, boldness, and grandeur ; and so happily related to each other ; that the eye finds, here, every thing, which can gratify its wishes in rude, wild, and magnificent scenery.

The lands in Bethlehem are beach and maple lands ; and, where they are not too much encumbered by stones, are tolerably fertile. The houses are chiefly log-huts : the settlements being very recent ; so recent indeed, as not to be mentioned in the census of 1790. In 1800, there were in this township 171 inhabitants ; and, in 1810, 422.

After leaving the hills of Bethlehem, the road turned again to the Amonoosuck ; along the banks of which it continued until we arrived within a mile and a half of the *Notch of the White Mountains* : a distance of about sixteen miles. It is chiefly free from stones ; but is encumbered with all the other inconveniences of a new road. The soil is fat ; and the mire, therefore, deep. The bridges, and causeys, of round poles, are far more numerous, and extended, than in any other part of the country, which I have visited : some of them being from one to two furlongs in length. They are also more neglected, and consequently more decayed, broken, and dangerous. In this region there are but three or four houses.

A reflecting traveller, passing over these roads, is naturally induced to recollect the situation of the first Colonists in New-England ; and to realize some of the hardships, which those intrepid people endured in settling this country. Among the difficulties, which they had to encounter, bad roads were no contemptible one. Almost all the roads in which they travelled, passed through deep forests, and over rough hills and mountains, often over troublesome and dangerous streams, and not unfrequently through swamps, miry, and hazardous ; where wolves, bears, and catamounts, haunted and alarmed their passage. The forests they

could not cut down: the rocks they could not remove: the swamps they could not causey; and over the streams they could not erect bridges. Men, women, and children, ventured daily through this combination of evils; penetrated the recesses of the wilderness; climbed the hills; wound their way among the rocks; struggled through the mire; and swam on horseback through deep and rapid rivers, by which they were sometimes carried away. To all these evils was added one, more distressing than all. In the silence, and solitude of the forest, the Indian often lurked in ambush near their path; and from behind a neighbouring tree took the fatal aim; while his victim, perhaps, was perfectly unconscious of danger.

On Friday the 30th we rode to the Notch; and here I renewed a prospect of all the delightful scenes, which I have mentioned in a former account. The first object, which after we had passed the solemn scenes at the entrance of the Notch, arrested our attention, was the fine brook, which I have described in my former journey to this place, as flowing so beautifully down a precipice of eight hundred feet, and which I shall take the liberty to denominate *the Silver Cascade*. The sun was at this time in the same advantageous position, as when we were here in the year 1797: a fact, which I found, was indispensable to the visibility of this delightful object. It was now in view from various positions, which we successively occupied, till two or three o'clock in the afternoon; when, the sun having retired behind the mountains, it vanished in the shade. In my first journey I was unable to examine this fine object in a near view, for want of time: but now, having sufficient leisure, we all determined to make our way, if possible, to the foot of the precipice, over which it descended. Upon trial, however, we found the intervening forest almost literally impassable from the fallen trees, the thick and tangled bushes, the numerous rocks, and the deep sloughs, with which it was every where replenished. After a tedious excursion, in which we made a very slow and embarrassed progress, we reluctantly gave up the design.

We were, however, repaid for our disappointment by our visit to the Flume. Here I ascended two of the precipices, over which its descent was visible from the margin of the bason at the bottom; my companions, several of those above, to the height of twelve or fifteen hundred feet. The splendour of the cascade was greatly enhanced by every ascent; and the whole prospect, changing from beauty to sublimity, left the mind in a mixture of astonishment and rapture.

From this spot we proceeded onward towards the exit of this passage. As we were slowly descending the declivity, I was forcibly struck with the thought of being on this singular ground early in the spring; when the snows were rapidly dissolving, and all the casual torrents were pouring their waters down these vast precipices into the valley. The magnificence of such a multitude of streams, descending almost perpendicularly from these lofty heights, and presenting to the eye a collection of cataracts, two and three thousand feet in length; the mingled roar of the torrents; and the hollow-sounding echo, filling the vast chasm; appeared to my fancy superiour to any thing, which I had seen or read, of the wild and awful majesty of nature, except the ravages of a volcano.

When we reached Lancaster, I had an opportunity of partially realizing this scene, in an animated account, given by Mr. and Mrs. Willard, who had been on this spot at the season of the year, which I had proposed; and who to intelligence and good-sense joined a strong attachment to the fine scenes of nature. They had passed through this valley, when the snows were dissolving under a copious rain, and every stream was swollen to its fullest size. They both agreed, that the scene excelled every conception, which they had hitherto formed of awfulness and grandeur.

When we had reached Davis' farm, we were presented with an object, entirely new, and not a little interesting.

A fire, which had not long before been kindled in its skirts, had spread over an extensive region of mountains on the North-East; destroyed in its progress all the vegetation; and consumed most of the soil, consisting chiefly of vegetable mould. The whole

tract, from the base to the summit, was alternately white, and dappled: while the melancholy remains of half burnt trees, which hung here and there on the sides of the immense steeps, finished the picture of barrenness and death.

We had now reached the utmost limit of our intended excursion to these mountains; and had examined attentively all the interesting objects within our reach. Bidding adieu, therefore, to this singular combination of wild and awful magnificence, we set out on our return to Rosebrook's. Here I observed, that the vast eminence, which I formerly mentioned as rising on the South-Western side of the Notch, was formed extensively of grey granite, striped with red; and that its awful cliffs descended almost perpendicularly from the top of the mountain to the bottom.

We left the Notch about two o'clock; and, having taken dinner at Rosebrook's, continued our journey to Jefferson; where we arrived at eight. The road we found little improved: the inhabitants being still few and poor. The first great evil, attendant upon the formation of these roads is, that the trees are not originally cut down to a sufficient extent upon both sides. Whenever they are left near the path, they cover it with a continual shade; and prevent the exhalation of the moisture. In this way the mire is often continued through the summer. The roots also, being interwoven with each other, render it impossible to obtain earth, sufficient for the purpose of covering the stones, or to make drains for drying the sloughs. The earth which can be obtained in most places, is nothing but vegetable mould; and this is so spongy, imbibes the water so easily, and retains it so long, that, in seasons not absolutely dry, the inconveniences, intended to be removed, are only increased. When the trees are cut down over a breadth of five or six rods, the road, being open to the sun, becomes in a great measure dry. The stumps, and roots, of most kinds, easily decay. Strong ploughs may be used with success; and solid earth may be procured in sufficient quantities. This, however, is a task, which demands more, and wealthier, inhabitants, than we found on this part of our journey. I ought to observe, that we found a considerable number

of the inhabitants strenuously labouring to remove these incumbrances.

We lodged at Denison's; and in the morning of October 1st proceeded to Lancaster; a distance of ten miles; where we continued till Monday.

Jefferson lies in the bottom of the great basin, which I have heretofore mentioned. The surface is generally level, and smooth; the soil moderately fertile; particularly that of a chain of intervals, lying along Israel's river. Like other low grounds, it is exposed to late vernal frosts; and is, therefore, ill fitted for the production of fruit. In Durand, a township at the foot of little Moosehillock, apples already grow in such quantities, that they are sold in Lancaster at a dollar a bushel.

Jefferson was originally called Dartmouth; and was incorporated under this name in 1773. In 1775, it contained only four inhabitants; in 1790, 111; in 1800, 112; and, in 1810, 197. The reason, why the population increases so slowly, is said to be the reluctance of the proprietor to sell the lands. The prospect in this valley is very noble.

On a rising ground upon the road, about two miles South-Eastward of Lancaster, we were presented with one of the most interesting scenes, which ever met the eye. At the distance of ten or twelve miles, on the Southern side of the basin, two mountains, spurs from those of Littleton, intrude finely into the valley. From the apparent summit of the farthest descended a stream, till it was hidden by the summit of the nearest. On this, from the highest elevation also, flowed another, somewhat obliquely to the course of the first, but so nearly coinciding with it, that for some time we thought it a branch of the same: for we did not, at first, take notice of the fact, although sufficiently obvious, that there were two mountains. A moment's attention, however, presented the whole scene in its true light. The nearer stream came from a South-Western direction, until it reached the point of vision, in which it joined the course of the other. Both struck the eye, when loosely attentive, as a single cascade; parted from the summit of the nearer mountain, descending a vast length down a

steep precipice, and glittering in the sunbeams like a torrent of liquid silver. The effect was magical : and the objects seemed more like the visions of fairy land, than like the coarse realities of this rude world. Our company consisted of five : and whatever diversities of taste we might experience, they were all harmonized, here, in a single gaze of astonishment and delight. Even the White Mountains were forgotten.

I am, Sir, yours, &c.

### LETTER III.

Northumberland—Little Moosehillock—Upper Amonoosuc—Stratford—The Peaks—Wales's location—Cockburn—Colebrook—Road to Hallowell—Grand Monadnoc—Canaan—Settlements beyond the Line on the St. Francis—Enterprize of New-England people.

*Dear Sir,*

On Monday morning, October 3, 1803, we left Lancaster; and pursued our journey to Stratford; sixteen miles; where we dined. In the afternoon we rode to Colebrook: twenty miles.

Northumberland, the next town above Lancaster, was incorporated in 1779. In 1775, however, it contained 57 inhabitants. The progress of population during the following fifteen years was very slow. In 1790, the number amounted only to 117. In 1800, they were 205. The settlements are principally in the Connecticut valley. In 1810, the number of inhabitants was 281.

I have heretofore observed, that the Mountains, above Lancaster, instead of running parallel with the river, meet it endwise. In Northumberland we passed the Western termination of the little Moosehillock; the Southernmost in this class. The highest summit in this range is not less than two thousand feet above the basin below. On its Northern side, we passed the Upper Amonoosuc. This river commences its course at the foot of the White Mountain range; and, running Northward along its Eastern base a little more than one third of its course, turns directly West to the Connecticut. Its whole length is about fifty miles. It is inferior in size to the lower Amonoosuc; its current is much more placid; and, flowing through a smooth, level bed, it is navigable for canoes throughout the whole of its Western progress; at the extremity of which there is a carrying place, of three miles only, to the Ameriscoggin. It is said to be bordered by extensive and valuable intervals. The valley, through which it flows, is of a beautiful form; and, so far as I was able to judge, furnished with a good soil; but is at present a mere forest.

Judd's fall interrupts the navigation of the Connecticut in Northumberland. It is formed by a ridge of rocks, perhaps twenty feet in height; the seat of some useful mills; but without either beauty or grandeur.

Stratford, the next town, was incorporated in 1773. In 1775, it contained 41 inhabitants; in 1790, 146; in 1800, 281; and, in 1810, 339.

Like Northumberland, it consists partly of rich and handsome intervals along the Connecticut; and of an interior, formed by the valley of the upper Amonoosuc, and of the range, which has heretofore been mentioned under the name of the Peaks. The height, and length, of this range differ scarcely at all from those of the little Moosehillock; but the appearance of its summits is widely different. I counted on this range five conical eminences; all of them uncommonly regular. The second is the most exact and beautiful cone, which I ever beheld. It is not improbable, that most, if not all, of them have been derived from volcanic explosions, which have long since ceased. This mountain is a noble object to the eye; and is seen on the road with the utmost advantage.

The houses in Stratford are inferior to those in Northumberland; which in several instances are good. The roads also, and several of the farms, exhibit strong indications of a lax and inefficient spirit in some of the inhabitants. On the Northern side of a brook, called Bog brook, there is a view of the White Mountains, which detected a curious optical illusion. Until we arrived at this place, we had never coincided in determining which of the summits of these mountains was the highest. We had seen them in a variety of places, and positions: but the difference of opinion continued, until on our return from the Line we came to this place. Here Mount Washington appeared so superior to the other summits, as to leave us astonished, that any doubt could ever have arisen.

The Connecticut valley presents considerably extensive and beautiful scenery in the Southern and middle parts of Stratford.

Between Stratford, and Cockburn, there is a *location*, (i. e. a grant of land, smaller than a township,) called *Wales's Gore*; containing between two and three thousand acres. On this spot the settlements were scarcely begun; and the road was very imperfectly made.

Cockburn was incorporated in 1770; three years before Stratford; and contained, in 1775, 14 inhabitants; in 1790, 26; in 1800, 109; and, in 1810, 142. These people give proofs of considerable enterprise in their buildings, farms, and roads. Our road, particularly, was for so new a settlement well wrought, dry, and hard. The lands, on the East of it, so far as our view extended, were composed of rough hills, wildly thrown together. Two lofty mountains, one named Preston Hills, in the Northern border; and another, to which I could find no name, but which I shall take the liberty to call the Sullivan Mountains, in the Southern, must, I think, be incapable of cultivation. The space between them is rough, and forbidding. Still it may be good grazing land.

Colebrook was incorporated the same year with Cockburn; and contained only 4 inhabitants in 1775; in 1790, 29; in 1800, 160; and, in 1810, 325.

In 1803, there were fifty families in this township; amounting probably to more than 250 persons. There were also 20 other persons, who had begun to cultivate the same number of farms. The land in Colebrook is universally capable of culture, and is rich. Intervals of the best quality spread in a beautiful manner along the Connecticut, throughout the whole breadth of the township; and the uplands, consisting of easy hills and vallies, are considered as equally fertile, and desirable. The road along the river is very good: as it is, indeed, from the Southern boundary of Cockburn to the place, where we crossed the Connecticut in Stuart; two miles from the Canada Line.

Every thing in this township exhibits the activity and enterprise of its inhabitants: their roads, plantations, barns, and school-houses. Their barns are large, and good; and their school-houses well built. Their dwelling-houses are principally of logs:

but they are beginning to form better ; and will soon be lodged very comfortably. Mills they have already.

The people of Colebrook are also sober, orderly, harmonious in their intercourse, their politics, and religion ; and already anxious, and in their own opinion able, to settle a minister, in conjunction with the inhabitants either of Stewart or Canaan, the townships opposite to them in Vermont.\*

The enterprise of these people is conspicuous in their undertaking to open a road between Colebrook, and Hallowell, in the District of Maine : their nearest port. This road has been already laid out. The distance has been found to be ninety miles. The ground is no where discouraging, and almost every where good. Through a considerable part of the distance settlements are already begun ; and throughout the whole, the soil, and surface, are well fitted for cultivation. The range of the White Mountains opens, here, a gap, resembling the Notch ; presenting scenery finely romantic ; and allowing a convenient passage for a road. This work has been begun with great spirit ; and is intended to be speedily finished. As it will ultimately furnish an important accommodation for the inhabitants, planted throughout the whole distance ; it will, of course, be kept in repair ; and will probably answer all the ends, proposed by those who have undertaken it. Its value to the people of this region, and to those of Hallowell also, can scarcely be calculated.

About two miles below Loomis's, the inn where we lodged, stands a lofty mountain, called the Grand Monadnoc, in Lynington, in Vermont ; ascending immediately from the river, and rising above its level about two thousand feet. Its elevation, measured from the surface of the ocean, is probably more than three thousand. This mountain makes a very noble appearance : its single summit being a fine, obtuse arch ; and its bosom shaggy, and cut into ridges by deep channels, towards the South-East. In the summer of 1802, *a cloud broke* on this mountain. A large rock, near the summit, on, or in the neighbourhood of which the stream fell, was washed clean ; the earth, with which it was cov-

\* They have since settled a respectable Clergyman.

ered, being all swept away ; and with its white surface discloses the spot to the eye of a traveller. A little beneath this rock, it wore a channel six feet deep ; and in its progress down the mountain carried away every moveable thing, in its course. The quantity of water, which fell, was prodigiously greater than the inhabitants had ever known to descend in a spot of the same extent, during the same time : and the effects of its violence were in their view unexampled.

Tuesday, October 4th, we left Loomis's, and rode to the Line ; crossing the Connecticut at a ford, two miles below, and passing through a part of the township of Canaan in Vermont ; or rather what was originally a location called Norfolk, lately annexed to that township. The river was here about fifty yards in breadth ; and in this region is usually of a breadth between that and twenty-five yards. In almost all places it was much too deep to be forded ; although the season was dry. The part of the road, which lies in Canaan, is chiefly by the side of a mill-stream, called Leet's brook. Monadnoc was the last mountain, which we saw in Vermont ; and Preston hills, in New-Hampshire. Northward of these mountains, the country consists of hills and vallies ; and the soil is fertile.

When we came to the Line, we found the settlements begun, and extended to a considerable distance within sight ; and, by their appearance, of some standing. By Mr. J. Ames, a respectable surveyor in Stuart, I was informed, that beyond Hereford mountain, which ascends about five miles from the Line, there are no hills, of any considerable height, in Lower Canada, for a great distance. The whole country, he observed, consists of moderate elevations, beautifully sloped, and interjacent vallies, open and handsome. The soil, he further observed, is generally excellent ; and the winters are by no means so severe, as to prevent the country from becoming a desirable residence.

By authority, which I could not doubt, I was assured, that plantations are already extended along the river St. Francis, (whose head waters descend from the hills in Vermont, only eight miles Westward of Colebrook,) quite down to the French settlements.

All, or nearly all, these plantations are formed by people from New-England. An inhabitant of Eaton, (twenty-eight miles North of the Line,) with whom I conversed particularly on this subject, and who appeared to be a decent and intelligent man, confirmed these accounts. He considered the township, in which he lived, as an agreeable residence. The terms, on which the lands were obtained, were, he observed, easy. The tenure, on which they were holden, was that of free socage, unembarrassed with any inconvenient restrictions or services : and the government was mild and equitable. He told me further, that the road to the *Three Rivers*, except sixteen miles of forested ground, was even then tolerable ; that it was considerably travelled ; and that without any serious expense, or labour, it might be made very good. It is in contemplation to open a road from Stuart to Quebec. The undertaking, it is said, will be attended with no peculiar difficulty : the ground being every where fitted for such a purpose. The distance to Quebec is estimated at one hundred and fifty, or one hundred and sixty miles ; and that to the St. Lawrence, by the St. Francis, at eighty. I have lately seen the opening of this road mentioned with approbation by Sir James Craig, the Governour of Lower Canada, in a speech, or message, to the Legislature of that province. There is no reasonable doubt, that the design is feasible ; nor that the execution of it will advantageous to both countries.

The township of Eaton, in 1803, contained sixty families.

A person who has extensively seen the efforts of the New-England people in colonizing new countries, cannot fail of being forcibly struck by their enterprise, industry, and perseverance. In Maine, in New-Hampshire, in Vermont, in Massachusetts, and in New-York, I have passed the dwellings of several hundred thousands of these people, erected on grounds, which in 1760 were an absolute wilderness. A large part of these tracts they have already converted into fruitful fields ; covered it with productive farms ; surrounded it with enclosures ; planted on it orchards ; and beautified it with comfortable, and in many places with handsome, houses. Considerable tracts I have traced through their

whole progress from a desert to a garden ; and have literally beheld the wilderness blossom as the rose.

There are minds, to whom little else than romantic adventures, splendid villas and palaces, the pomp of courts, the progress of armies, the glory of victories, and other magnificent displays of wealth and power, can give even a transient pleasure. To me there is something far more delightful in contemplating the diffusion of enterprise and industry over an immense forest ; where no oppression gives birth to the efforts of man ; no sufferings have preceded the splendour ; and no sacrifice of life, or even of comfort, is necessary to the existence of the triumph. The process is, here, all voluntary and free. In its several stages the forest is converted into a cultivated country ; and lands literally useless, are made to yield sustenance, and convenience, to mankind. Poverty is here commuted for competence, and competence for wealth. Towns and villages, in vast multitudes, rise up in the retreats of bears, and wolves ; and churches assemble for the worship of God the numerous inhabitants, to whom he has given so goodly a heritage. Schools also, and Colleges, enlighten, here, the young mind with the rudiments, and in many instances with the higher attainments, of knowledge. Thus rational and virtuous man sees his race multiplying beyond all customary calculation, in the midst of blessings, equally and universally diffused, and obtained without fraud, without oppression, and without blood.

These thoughts will naturally rise in the mind of a contemplative traveller, standing on this spot, and foreseeing, what he can scarcely fail to foresee, that the immense forests, North, and East, and West, of his eye, will at no great distance of time be converted, as those on the South, have lately been, by these active people into a well cultivated country, filled with the blessings of this life, and with the means, and hopes, of life beyond the grave.

I am, dear Sir, yours, &c.

## LETTER IV.

Stuart—Salmon—Vegetation and Products of this region—Account of Maize—Native Animals—Return to Lancaster.

*Dear Sir,*

HAVING examined every thing within our reach, in the neighbourhood of the Canada Line at this place, we returned in the afternoon to Colebrook. On our way we were overtaken by a copious rain, which continued through the remainder of the afternoon. This period I spent very pleasantly in making a great variety of enquiries concerning the surrounding country, and particularly concerning the rise and progress of Connecticut river. The persons, with whom I conversed on these subjects, were intelligent, and fair; and their accounts peculiarly satisfactory.

Stuart differs immaterially from Colebrook; except that the settlements are more recent. In the year 1790, there were no inhabitants in this town; in the year 1800, there were 99; and in 1810, 186. The same industry, and spirit, are visible here, which we observed in Colebrook; and the same good characteristics generally. The soil in the interior is said to be rich. The River throughout this township and Colebrook, for about twelve miles in length, winds through a succession of most beautiful intervals; which may be said literally to glow with verdure. The valley is here from a mile and a half to two miles wide; and a richer scene can hardly be conceived.

Salmon were heretofore caught in Colebrook in great numbers; but they have been entirely stopped by the several dams, erected below. It is a remarkable proof of the strength of this fish, that it is able to ascend such falls, as those at South Hadley and Rockingham: yet the evidence of the fact is complete: the salmon being invariably known to return to the ocean in the latter part of the warm season.

The lands in Stuart, Colebrook, and other parts of the circumjacent country, yield wheat, rye, barley, oats, flax, maize, and

grass, in abundance ; together with the hortulan vegetables, common to other parts of New-England. Wheat yields, ordinarily, from twenty to thirty bushels an acre. The spring wheat is esteemed a surer crop, than the Autumnal ; the latter, it is said, being covered with snow before the ground is frozen, becomes too warm, moulds, and decays.

The evil would, I think, be prevented by sowing the wheat late. In this case, it would grow so little, as not to cover the ground ; and therefore would not mould. At the same time, being here regularly sheltered by snow during the whole season, in which danger is to be apprehended from the frost, it would be safe from that enemy also. The experiment ought certainly to be made ; particularly, as the Autumnal wheat, when it escapes this destruction, is better, and more productive, than that which is sown in the Spring.

Maize yields forty bushels an acre. The kind, planted here and throughout all this region, is that, which in New-England is called *Canada corn* : the seed having been originally brought from that country. Its produce is abundant ; and its weight, and quality, not materially different from the flint corn of Massachusetts and Connecticut. The season of vegetation, here, is not sufficiently long to bring the flint corn to perfection.

All the English accounts of this useful vegetable, which I have seen, are very defective. You will, therefore, permit me to give you a more complete catalogue of its species, than any other within my knowledge. It will I presume be incomplete ; but it will include a greater number of varieties, than those, which have hitherto been published.

Names.	Colour.	Varieties.	Rows of Kernels.
Canada corn,	yellow,	two,	} 8 } 12
Flint,	yellow, } blue, } red, }	two,	{ large, } { small, }
Nantucket,	yellow,	one,	12
Chicken,	yellow,	one,	8
Sweet,	white,	one,	8

Names.	Colour.	Varieties.	Rows of Kernels.
Long-Island,	white,	two,	{ 8 } sweet.
Guinea,	white,		{ 12 } insipid.
Virginia,	white,	one,	{ from 12 upwards, sha- ped like a gourd seed.
Carolina,	white,	one,	8
Missouri,	yellow,	one,	8

The earliest, and smallest, of these is the Chicken corn; and the next the eight rowed Canada. The next after these is the Sweet. All these may in a favourable season be planted so early as to furnish seed for a second crop, which will come to perfection the same season, at New-Haven. The Chicken corn rarely exceeds the height of five feet; the Canada seven; and the Sweet eight. The Nantucket differs little from the Canada, except that it is later. The ears of the Chicken corn are scarcely more than four inches in length; and its produce is trifling in quantity and value. The Sweet or Shrivelled corn, so called, because, when it is ripe, the kernels are remarkably shrivelled, and the Long-Island Sweet, which is large, and comparatively late, are, when in the milk, the most delicious of all culinary vegetables.

The Flint corn grows to the height of ten feet; and is the heaviest, the most nutritious, and most productive of all the species.

The Carolina, and Missouri, grow at New-Haven to the height of fifteen feet: but the season is rarely long enough to bring either of them to perfection.

Snow commonly falls at Stuart and Colebrook about the middle of November; and is gone about the middle of April. The Connecticut was crossed on the ice at Cockburn, May 2nd 1798. For three years past, beginning with 1801, there has been very little snow in this region.

Ploughing is commonly begun, here, about the 1st of May. Maize is planted near the end of the same month.

The following wild fruits grow in this region.

Three sorts of currants are found in the forest: the red, the black, and a peculiar kind, called Skunk currants.

Two sorts of gooseberries, also, grow wild here: the prickly and the smooth. The smooth gooseberries are larger than pistol bullets; but are scarce. The prickly are smaller, and abound.

Blackberries grow, but not in abundance.

Raspberries may be literally said to fill the country. The only species, which I saw, were the common and crimson; and these wherever the forests are cut down, spring up in infinite numbers. We saw raspberries fresh, and good, on the bushes, the third of October.

The black mulberry is a native of this country, particularly in Stratford.

Two kinds of wild cherries grow here: the red and the black.

Cranberries grow in Colebrook on bushes, seven or eight feet high. The fruit differs little from the common kind.

The Strawberries are large, and finely flavoured.

Of the native animals of this country I have received the following information, which may be relied on as correct.

Beavers are still found on this River, particularly on its upper branches, both in New-Hampshire and Canada. Bears abound. Racoons, and Deer, are scarce. There are no Elks.

Moose were diminished in their numbers, until since the year 1800; when the winters having been very mild, and very little snow having fallen, they have escaped the ravages of the hunters, and have again become considerably numerous.

The Wolverin is found here. This animal is of the size of a small dog; and is striped perpendicularly, like a racoon, from the back to the belly: it is fierce, and voracious; and frequently destroys sheep.

Foxes, of two kinds, inhabit these forests; one red; the other grey, spotted with black.

Two grey squirrels, only, have been seen in this neighbourhood. There are none of the black kind: but red, striped, and flying, squirrels abound. Hedgehogs are frequent.

The bird, called Crossbill (the *Loxia* of Linnæus,) is, so far as I know, found here only, in New-England. Its size is that of a blue bird: its colour, a mixture of red and grey. The upper

part of its bill crosses the lower part, so that, when eating, it is obliged to turn its head sidewise toward its food.

Wednesday, October 5th, we left Loomis's in the morning; and rode to Lancaster thirty-six miles. The only object which caught my attention on this part of our journey, and which I have not mentioned, was a collection of cliffs, of blue argillaceous schist; more ragged, wild, and fantastical, than any thing, of which I had ever formed a conception. The strata were scarcely two inches in thickness; and wound in every direction, angle, and curvature, which can be imagined. Had the mass been in a state of semi-liquefaction, and stirred with rods in every possible manner; and had the substance cooled, and stiffened, immediately after the passing of the rods; an effect would have been produced, imperfectly resembling the labyrinthine windings of these strata. To increase this confusion, the several masses, or if they may be so called, rocks, of which the whole pile was composed, pointed in all directions; so that the edges of the strata were directed towards every part of the heavens; and, to complete it, the rocks are thrown together, and heaped upon each other, in such disorder, as if they had been taken up by a tornado, and violently shaken down on this spot.

We arrived at Lancaster in the evening without any accident; and the next morning began our journey homeward through Dalton.

I am, Sir, yours, &c.

## LETTER V.

Weather in the country about Lancaster—Prospect at Newbury—Vegetation at Lancaster.

*Dear Sir,*

IN my journey of 1797, I remarked, that the weather in the country above Haverhill\* differed materially from what is usual in the Southern parts of New-England. In that of 1803, I met with many additional proofs of the justice of these remarks. On Tuesday, October 4th of this year, I set out with my companions from Colebrook to visit the Canada Line, at the distance of ten miles from Loomis's. The sky was overcast during the night before; and in the morning a cloud, settling on the summit of the Grand Monadnoc, threatened us with rain. About twelve o'clock the rain began; and continued to fall plentifully through the afternoon and evening. On the morning of Wednesday the wind blew a strong gale from the North-West. The clouds still hung upon Monadnoc, and upon all the other high mountains, which were visible, until about three o'clock P. M. Soon after we began our journey, the rain commenced again; and continued to descend in showers, successively, and swiftly, passing to the South-East, till the middle of the afternoon. The wind then gradually ceased; and the air settled into an entire calm. The sky, however, was overspread with broken clouds, until it became dark. Soon after the night began, the clouds suddenly disappeared; the heavens assumed their brightest and most serene azure; and the moon rose in her utmost beauty and splendour. As I walked with the Rev. Mr. W. from the street in Lancaster to his house, the distance of a mile; I did not observe a single cloud. This serenity continued sometime after eleven o'clock. Soon after twelve, a settled and very copious rain began; and continued till morning. After breakfast we set out for Bath, through Dalton, Littleton, and Concord, the wind still North-West. The morning was

\* I have since found that this difference commences at Haverhill.

perfectly bright : but soon after we began our journey the clouds came violently from that quarter, and brought a succession of showers till some time after noon. A little before we descended the mountains of Littleton into the valley of the lower Amonosuc, the rain ceased : yet on the mountains it continued to be showery most of the day. On Friday we left Bath in the morning, under a cloudy sky. For two or three miles a little rain fell, mingled with hailstones, sparsely scattered. Both, however, soon ceased : but the showers, as we learned from some gentlemen who followed us, continued with violence on the mountains. During all this period the wind was North-West : in the Southern parts of New-England an almost certain source of fair weather.

On Wednesday, snow fell at Colebrook in extremely small quantities. On Thursday it fell more copiously at Littleton ; but not sufficiently to whiten the ground. On Friday morning it completely covered the earth at this place : while at Bath there was not a single flake.

After we had left Bath, we rode about four miles, and came into the Connecticut valley. The clouds now rose suddenly into the higher regions of the atmosphere. At ten o'clock, the weather became remarkably fine ; and the sky universally serene, and beautiful. At two, while we were dining at Bradford, the wind veered instantly to the South ; the air became uncomfortably cold ; and the sky was overcast with clouds, until nine in the evening. The clouds then suddenly retired again ; and the heavens resumed their brightness and serenity, until a little before day. Then they were again overcast. At nine o'clock ; the wind North-West ; the clouds vanished again ; the day became very fine ; the weather mild ; and the sky of that peculiarly beautiful blue, which so often adorns the month of October.

We arrived at Newbury on Friday about eleven o'clock ; and were not a little gratified with the charming weather, rendered doubly agreeable by the remembrance of the preceding, gloomy season. As we were passing through the pleasant street of this town, we were amply repaid for our sufferings by the singularity and splendour of the prospect, to the perfection of which this stormy season had in no small degree contributed. The expan-

sion, in which Haverhill and Newbury are built, is seen from this place with the highest advantage. As we cast our eyes up and down the river; itself an object extremely beautiful, and with its romantic meanders extensively in view; a chain of intervals, sometimes on one, and sometimes on both sides, reaching from North to South not less than ten or twelve miles, spread before us, like a new Eden, covered with the richest verdure, and displaying a thousand proofs of exuberant fertility. This spot was bounded on both sides by rising grounds; now sloping; now abrupt; always interesting; and overspread alternately with forests, farms, and villages. Beyond these a train of hills, throughout the whole extent, adorned with a variety of summits, and terminating at the South-Western limit in the noble bluff, which I have mentioned under the name of Sawyer's mountain, formed an elegant transition from the inferior to the superior parts of the landscape. The birds around us sported, and sung, with the highest glee. A vast multitude of neat cattle, horses, and sheep, were cheerfully cropping the verdure of the rich fields beneath us, wandering about them in frolic, or quietly ruminating in the shade. The farmers, were gaily pursuing the various business of the field: and the children, more gaily still, were occupied at their play. Over against us in full view, rose the handsome village of Haverhill. Three or four miles North-Eastward, ascended two rough mountains; one an obtuse cone; the other a beautiful sugarloaf; and with their peculiar forms finely varied the landscape. Behind the village of Haverhill at the distance of seven or eight miles, Moosehillock, a stupendous elevation, always reminding me of that description in Milton,

"The mountains huge appear  
Emergent, and their broad, bare backs upheave  
Into the clouds: their tops ascend the sky:"

rose to the height of four thousand five hundred feet, covered with snow on the summit, of a dazzling whiteness, but grey, and grisly, as the eye descended towards the base. To finish the prospect, a chain which I have mentioned as skirting the White Mountains on the South-West, ascended at the distance of forty

miles North-West of Newbury, clothed in the most brilliant attire of January. This contrast of summer and winter, of exquisite beauty and the most gloomy grandeur, had the appearance of enchantment; and left an impression which can never be forgotten, until every image shall fade out of the memory.

I will now return to Lancaster; the starting point, whence all this train of excursions have been made; and finish my observations upon this town.

The common crop of wheat, here, is from fifteen to twenty bushels an acre; and that of maize from twenty-five to forty; according to the variations of the seasons, and the husbandry. Spring wheat has been generally sown: but some late experiments have shewn it to be highly probable, that the autumnal wheat may be sown with success. Two acres of white pine plain, belonging to Major W. of this town, yielded, in 1797, a little more than one hundred bushels of this grain.

Apple trees were unprosperous in Lancaster, until since the year 1794. In 1797 they were growing, in one nursery at least, very thriftily. In all parts of this country, where the vegetable mould is deep, I suspect the same misfortune will be found for a short time. The texture of this mould is so loose, that, whenever trees are planted in it, the roots are not embraced with a sufficient closeness, and uniformity, of adhesion. A tree cannot grow thriftily in a very close, or very loose, soil. In the former case, the roots cannot penetrate with sufficient ease, and rapidity; nor the water be supplied to them either in that quantity, or in the uniform manner, which is indispensable to their prosperous growth. In the latter case, the soil either retains the water, like a sponge, or, like a sieve, permits it to percolate with too much celerity. In wet seasons, the vegetable mould retains so much water, that the roots may be literally said to swim. In dry seasons, the mould scarcely adheres to the roots at all; and of course supplies them with little or no nourishment. Wherever the native earth shall have been sufficiently mixed with this mould by the plough; apple-trees, and probably many other fruit-trees, may grow, here, as well as in the Countries below.

I am, dear Sir, yours, &c.

## LETTER VI.

Connecticut River.

*Dear Sir,*

HAVING explored Connecticut river almost throughout its whole length, and being about to take my leave of it, in these letters, I will proceed to give you a description of it. As it has never been justly described; and as it is an object of primary importance to the geography of New-England; I flatter myself, that the following account, of the correctness of which you may be assured, will not be esteemed by you an improper part of my general design. The section of this river, which I have not personally examined, was described to me by Mr. Hughes; a discreet and intelligent inhabitant of Colebrook; who had often explored its whole progress, and who spent an afternoon in stating, and correcting, his own apprehensions concerning it, mile by mile, from its fountains to the place, where we forded it in our journey to the line. To his observations I was able to add those of Mr. Ames of Stuart; the surveyor mentioned above; who was also well acquainted with many parts of its course. The information of Mr. Ames and Mr. Hughes, was harmonious in every thing, which had been observed by both.

Connecticut River rises in New-Hampshire. Its fountains are between  $44^{\circ}$ ,  $50'$  and  $45^{\circ}$  North Latitude, and nearly in  $71^{\circ}$  West Longitude from London; about twenty-five miles Eastward from its channel, where in the same latitude it divides Stuart and Colebrook from Canaan in Vermont. These fountains, which are at the distance of two or three miles from each other, flow in two small, converging rivulets; one of which empties its waters into a pond, covering about six acres, whence it proceeds to a lake, which from its resemblance to the numerical figure 8, I shall name *Double Lake*. The other rivulet, also, unites with the same lake; which is two miles long, and half a mile wide; and covers between five and six hundred acres. Hence the waters flow in a

single channel, about seven miles, into another lake, which from its figure I shall call *Heart Lake*; about six miles long, and three broad, and covering between nine and ten thousand acres. From Heart Lake with a material addition to its current, the river runs North-Westward four miles and a half; and is a continual rapid through the whole distance. In one part of this reach it descends fifty feet in a course of three hundred. Below the rapid, it receives from the Northward a stream called Perry's Brook; and a little further down, another, called Cedar brook. About two miles further on, it receives another from the South, called Dead water brook; and, about a mile further, a fourth from the North, called Back brook, conveying into it the waters of a small lake, called Back lake. That portion of the Connecticut, which is between Perry's brook and Back brook, four miles in length, is named *the Dead water*: the ground on either side being low, and level; and the stream, winding, sluggish, and deep. After receiving the waters of Back brook, it runs for one mile over a succession of rocks, termed the Great falls; in one part of which it descends, perpendicularly, over a ledge twelve feet. Two miles below these falls, it receives the waters of Indian river; commonly known by the name of the Western, or Canada branch. This stream runs a course of about forty miles; and has its origin in the range of hills, which separate the District of Maine from Lower Canada. During the first half of its course it winds generally Westward; and throughout the other half makes a straight progress directly South, until it joins the Connecticut. Between two and three miles below its confluence with Indian river, the Connecticut receives Hall's river; which runs South, also, about twenty miles, and joins it very near the forty-fifth degree of North Latitude. Just below their confluence, there is another fall, extending about twenty rods. A little above Hall's river, a considerable brook, called Bishop's brook, joins the Connecticut from the South; and has its origin and course in the township of Stuart.

Before its junction with Indian river, the Connecticut runs about the same distance with that stream; and discharges more

than twice its quantity of water into the common channel. Hall's river is sensibly less than Indian river.

The course of the Connecticut to Perry's brook, between twenty-five and thirty miles, is North-Westward; thence to the forty-fifth degree of North Latitude West-South-West; thence to the city of Hartford South-South-West; and thence to the Sound about South-East.

The length of this river is about four hundred and ten miles. From Griswold's point, in Lyme, to the forty-fifth degree of North Latitude, the distance, measured upon its waters, is about three hundred and seventy-four; and thence to the head waters, from thirty-five to forty. Its meanders throughout a great part of its course are almost perpetual.

The number of its tributary streams is very great. The principal of these are the following.

On the West.	Length, about miles.	On the East.	Length, about miles.
Indian River,	- - - - 40	Upper Amonoosuc,	- - 50
Halls,	- - - - 20	Lower Amonoosuc,	- - 50
Posoomsuck,	- - - - 40	Ashuelot,	- - - - 50
White,	- - - - 50	Miller's,	- - - - 35
Waterqueechy,	- - - - 30	Chequapee,	- - - - 50
West,	- - - - 37	Scantic,	- - - - 30
Deerfield,	- - - - 45	Salmon,	- - - - 30
Agawam,	- - - - 45		
Farmington,	- - - - 65		

The waters, which form the Connecticut, are remarkably pure and light; such as we commonly term the best water for washing. The tributary streams, almost without an exception, issue from hills, formed of stone, covered with a gravelly soil; and roll over a gravelly, and stony bed, through their whole progress. The waters of the parent stream are, therefore, every where pure, potable, perfectly salubrious, and inferiour to none in the world for the use of seamen in long voyages.

As a navigable water, this river is inferior to many others of a smaller size. This is owing to two causes; falls, and shallows. the falls are the following.

Names.	Towns in which.	Distance of their commencement from the mouth.	Length on the river.
Little falls,	- - - - -	350 miles.	- - 4½ miles.
Great,	- - - - -	340 "	- - 1 "
Indian,	Stuart, - - - -	335 "	- - 20 rods.
Judd's,	Northumberland,	281 "	- - 20 "
Fifteen-mile,	Dalton and Lyman,	260 "	- - 15 miles.
Lebanon,	Lebanon, - - -	201 "	- - ¾ mile.
Waterqueechy,	Plainfield, - -	193 "	- - 50 rods.
Bellows,	Rockingham, -	158 "	- - ½ mile.
Miller's,	Montague, - -	120 "	- - 8 miles.
South-Hadley,	South-Hadley, -	85 "	- - 3 "
Enfield,	Enfield, - - -	63 "	- - ¼ mile.

The Fifteen mile falls, Waterqueechy, and Enfield, and the greatest part of the distance attributed to the others, are mere rapids; and there are also some other small rapids, which are of no consequence.

The distances from the mouth are measured on the road.

The sloop navigation of this river extends to the foot of Enfield falls; but is of no great value above Hartford. Enfield falls are passed by boats without difficulty. Boats go down the falls of Waterqueechy, but cannot easily ascend them. To their foot, one hundred and ninety-three miles from the mouth of the river, the navigation for boats carrying twenty-five tons, is by the canals heretofore described, rendered clear, and safe. A little labour, bestowed on the falls of Waterqueechy, and locks with a strong dam, at those of Lebanon, would extend the navigation to the foot of the Fifteen mile falls, about two hundred and forty-five miles. Whenever the country above shall have become universally settled; these obstructions will undoubtedly be removed. At present, the quantity of business is insufficient to justify the expense, necessary for this purpose.

I have asserted above that the tributary streams of the Connecticut are eminently pure. In the season of the vernal floods there is a remarkable exception to this general truth. At this season, the dissolution of snow, and descent of rains, wash large quantities of soil from the hilly regions, on both sides of the river; and convey a prodigious mass of the finer particles along its channel towards the ocean. A great proportion of this mass contributes to the increase, and fertility, of the intervals, which so extensively form its banks. Another, and not an inconsiderable part, subsides in the bed of the river; and embarrasses the navigation by a succession of shallows. In a stream so winding, the channel changes irregularly from one bank to the other. In a stream so fluctuating, the channel shifts in some degree from year to year. Hence the shallows are subject to continual variations, as to their depth, their position, and their extent; and are, therefore, incapable of being accurately described.

The first, and most important, of these shoals, is a bar, at the mouth, called Saybrook bar. This lies in the Sound, at a small distance below Lynde's and Griswold's points, which form the mouth; and extends quite across the stream. On it are found, at the usual tides, but ten feet of water. It owes its existence to the earth, wafted down the river. At this spot the stream is met, and stopped, by the tide of the Sound. Here the waters of the river become quiescent; and the earth, being heavier than the water, and ceasing to be borne along by the current, subsides. The shoal, thus begun, rises continually, until the space between its own surface, and that of the river, becomes so small, as to be barely sufficient for the passage of the water, in a current of the usual rapidity. Whenever this is accomplished, the earth is carried over the bar by the same cause, which wafted it thither.

Shoals, formed by means substantially the same, are scattered up and down the stream, from Saybrook to its fountains. The current is often oblique; and often reflux. From these facts, the water in various places becomes quiescent; and, whenever such a quiescence exists, the earth, before suspended in the

stream, is deposited. A shoal is thus begun, and increased, until the shifting of the current carries it away. To this shifting the shoal itself contributes; and the river is consequently in a continual fluctuation. All rivers, which flow through a fat soil, are subjected to similar changes. The Mississippi, the Nile, and the Ganges, have in this manner produced their shoals, and their Deltas; which were once no other than shoals.

Several of these shoals exist between Saybrook and Hartford; one or two below Middletown, and some others above; one of which stretches across the channel, and has only six feet water at full tide: I mean when the river is at its most usual height. In consequence of these obstructions, loaded vessels, of more than seventy tons, cannot sail from Hartford.

Above Fifteen mile falls, the river is navigable for the boats, heretofore mentioned, to Judd's falls. Above these, it can be passed in similar boats, except when the stream is low, and even then in birch canoes, to the forty-fifth degree of North latitude. Hence, with the exception of three carrying places, around Indian, Great, and Little falls; the first of twenty rods, the second of a mile; and the third of three miles; it is passed in such canoes a mile and a half above Heart lake. Indian river admits the same canoes eighteen miles; and Hall's river about five. There is one short carrying place in Indian river, about four miles from its mouth.

Produce has been conveyed from the foot of Fifteen mile falls to Hartford.

A company, as I have heretofore observed, was formed at Hartford in the year 1800, with a capital of \$80,000, for the purpose of improving the navigation between that city and the Sound. They have begun their operations with such success, that they have already increased the depth of the river a foot and a half. Strong hopes are rationally entertained of accomplishing much more. Were a channel of sufficient depth completed across Saybrook bar, and some small obstructions lessened further up, vessels of two hundred tons might ascend to Middletown, thirty-three miles from the mouth. The only serious difficulty in accomplish-

ing this design exists in the apprehension, that the channel, when completed, would soon be filled up. Whether this apprehension be well grounded, or not, I am unable to determine.

Salmon, not i mprobably the finest in the world, were in great numbers caught until very lately, in the waters of this river quite up to Colebrook. Since the erection of the several dams, which have been mentioned, they have chiefly, or wholly, deserted it. Shad were formerly taken in abundance as high up as Bellow's falls. They are now stopped by the dam at Montague. Herrings are plentifully taken as high up as Wethersfield. Since the salmon have left this river, it is frequented by great numbers of the striped bass. It abounds, as do its tributary streams also, with the smaller river fish of this climate.

I am, Sir, yours, &c.

## LETTER VII.

### Valley of the Connecticut.

*Dear Sir,*

*The Valley of the Connecticut* is a tract of land, extending from the Sound to Hereford Mountain; five miles beyond the forty-fifth degree of latitude. In the largest sense it includes the tract, which is bounded by the Lyme range on the East, and by a confused cluster of hills, commencing at the Sound, and terminating below Middletown, then by the Middletown range, then by that of Mount Tom, and then by that of the Green Mountains, on the West. In this sense, it is of very different breadths, from five miles perhaps to forty-five; and its surface is composed of an indefinite succession of hills, vallies and plains. But there is another sense, in which the phrase is used with more obvious propriety, and in which it denotes that portion of this vast extent, which appears as a valley to the eye, moving in the road along its course from its mouth to the great bend in the Northern part of the township of Stuart.

Understood in this manner, the Valley of the Connecticut consists of a succession of openings, or, as I shall term them, expansions; differing from each other in their breadth, and still more from the intervening, narrow glens, by which they are united.

The first of these expansions, as we advance from the Sound, commences about five or six miles below Middletown; and extends to Stepney, about twelve miles from North to South, and about the same distance from East to West. In this expansion lie the large townships of Middletown, and Chatham, and the township of Durham. The valley of Durham opens from it, on the Eastern side of the Middletown range to the Sound at East-Haven. The view of this expansion, taken from an advantageous stand, is most interesting to the traveller. The objects, of which it is composed, are fashioned with uncommon elegance; and selected, and arranged, with peculiar felicity.

The second, and largest expansion on this River begins at Stepney; and extends from sixteen to twenty-four miles in breadth, and from its Southern limit to Mount Tom, and Mount Holyoke: fifty miles. From its South-Western border, the valley of Berlin opens between the ranges of Middletown, and Mount Tom, to the Sound at New-Haven: thirty-four miles. This expansion contains the townships of Wethersfield, Hartford, Berlin and Windsor, a part of Granby, Suffield, West-Springfield, a part of East-Hampton, and a small tract of Northampton, on the West of the River; and on the East, Glastonbury, East-Hartford, Vernon, East-Windsor, Ellington, Somers, Long Meadow, South Wilbraham, Springfield, Wilbraham, Palmer, Ludlow, South-Hadley, and Granby; together with the skirts of other townships, both in Connecticut and Massachusetts. The prospects, presented by this expansion, are in many places extremely beautiful, and every where magnificent.

The third great expansion begins immediately North of the mountains Tom and Holyoke; and extends to the North line of the State of Massachusetts. Like the others, it opens through the valley of Farmington, from the South-Western quarter, to New-Haven: seventy-six miles. On the Sound the vallies of Durham, and Farmington, are at the utmost distance not more than five miles asunder; while on the Connecticut, they are sixty. The prospects in this expansion I have heretofore particularly described. It contains the townships of Southampton, East-Hampton, West-Hampton, Northampton, Hatfield, Williamsburgh, Whately, Deerfield, Greenfield, Bernardston, Gill, and Vernon, on the West; and on the East, Hadley, Amherst, Sunderland, Leverett, Montague, Northfield, and Hinsda'e together with a part of several other townships. To a traveller it presents a variety of very beautiful landscapes. Deerfield Mountain rises in this expansion at the distance of fifteen miles from its Southern limit; and extending Northward about twelve miles, sinks gradually almost to a plain; but ascends again at the distance of a few miles, and passes onwards to Vermont. This expansion at the South end, is about twenty-four miles in breadth; the North-

ern, about fourteen ; and the Middle, about eight. The openings on both sides of this mountain between the two ends of this expansion, as seen from Mount Holyoke and other commanding situations, are remarkably interesting objects.

The fourth great expansion is that, which I have described in the account of Lancaster.

Besides these there are beautiful openings at Walpole, Charlestown, Windsor, Orford, Haverhill, Stratford, and Colebrook ; together with many others, so small as not to merit particular notice. Several of these, particularly those at Charlestown, Haverhill, and Colebrook, are from ten to twenty miles in length. All these openings are handsome ; some of them beautiful.

The Valley of the Connecticut extends through almost four degrees of latitude ; and is bounded on the North by Hereford mountain ; a magnificent eminence, ascending five miles beyond the line. The superiour limit of this mountain is an arch more gracefully formed than that of any other, within my remembrance. Its elevation is about 2000 feet above the neighbouring country.

The *Intervals* on this Valley begin at Hall's River about twelve or fourteen miles from its mouth. The word, Interval, you have undoubtedly observed, is used by me in a sense, altogether different from that, which it has in an English Dictionary. Doctor Belknap spells it *Intervale* ; and confesses his want of authority for the use of the word. There is in truth no such word ; unless we are to look for its existence in vulgar, and mistaken pronunciation. Originally, when applied to this very subject, it seems to have meant nothing more than that extent of ground, which lay between the original bank of the river, and the river itself. This extent was composed of land, peculiar in its form, and qualities. The English, so far as I know, have no appropriate name for grounds of this class. Whether such lands exist on the rivers in Great Britain I am ignorant ; having never seen any definite account of them ; or allusion to them, in any book, descriptive of the surface of that country. From the accounts in Sir John Sinclair's Statistical History of Scotland of the lands on some rivers in that country, I should suppose, that a part of them

must be Intervals. Yet they are distinguished by no appropriate name. On some rivers in this country there are none ; and on others, very few. Wherever they exist, they are objects of peculiar attention to farmers, and subjects of much customary conversation. That a name should be given to them, therefore, is a thing of course. Interval is the name which they have accidentally obtained in this country : and a New-Englander relishes it more than *flats*, and *bottoms*.\*

This word, in its appropriate meaning, denotes lands, formed by a long continued, and gradual alluvion of a river. The origin of these lands may be thus explained. The tributary streams of the Connecticut run every where through a soft and rich soil, considerable quantities of which particularly the lighter and finer particles are from time to time washed into their channels by occasional currents, springing from rains, and melted snows. Wherever the stream moves with an uniform current, these particles are carried along with it ; but, wherever the current is materially checked, they are in greater or less quantities deposited.

In this manner a shoal is formed at first, which, as the particles gradually accumulate, rises slowly towards and ultimately above the ordinary surface by the subsidence of these particles, when the river is high. You will easily believe, that in a long continued progress of years every stream, where it flows through mere earth, must gradually deepen its bed. With regard to Connecticut river, I have seen the most abundant evidence, that the channel is deeper throughout almost every part of its progress than it was formerly. In every such case, the lands, formed in this manner, stand of course above all the ordinary floods ; and some of them above the highest.

The existence of some cause to check the current is absolutely necessary to the formation of Intervals. Wherever such cause is found, Intervals are found, proportioned as to their size and quality, to the following things : the room furnished on the side of the stream for their formation ; the extent and power, of the check ; and the lightness of the soil about the tributary streams.

\* Names for the same lands in States, South of New-England.

All these must co-operate, or Intervals will not exist ; and all these actually co-operate, in the region under consideration.

According to these remarks, such lands are universally formed by rivers, conveying slime, wherever sufficient space is furnished for their reception ; and where falls, streights, points of land, or any other causes, check the current. On the contrary, wherever the current is uniform ; the water at all times pure ; or the banks high, sufficiently near to each other, and sufficiently firm, merely to yield a passage for the stream ; Intervals are not, and cannot be formed.

A great part of the Intervals on the Connecticut appear to have been, and all of them probably were, originally islands. This is strongly evident with respect to those now forming, or which have been lately formed. All these now are, or certainly have been, Islands. Besides, the rear of all those, which I have examined, (and these are numerous) is considerably lower than the mass ; and wears obviously the appearance of a channel. The facts evidently seem to have been these. The principal channel of the river was formerly on the rear of the Interval ; and the alluvial soil was accumulated sufficiently to straiten the channel and check the current. The stream sought a new passage for itself ; and gradually wore it deep enough to receive the whole body of water. During the same period the original channel was filled up by new accessions of soil. But, as this was the place where the river ran longest, and retired last, it has rarely been filled to the common level. With this exception, Intervals are universally lower towards a river ; and resemble terraced plats in a garden. They are also undulating, where there is the same general level ; the channels of the waves being always parallel with the course of the river at the time they were formed.

These lands are subject to many changes. Every new obliquity of the current wears away some part of the interval, against which its force is directed. In the progress of such changes the inhabitants on the Connecticut have already seen large tracts gradually removed from one side to the other. The former chan-

nel, in the mean time, has been filled up, so as in many instances to leave no trace of its existence; and a new one has been worn through the solid ground. Nor is this all. This channel has been sometimes gradually removed by the encroachments of the river on both sides beyond the nearest bank of the former.

From the manner, in which these lands were brought into existence, we shall easily believe, that they are of the richest quality. Such is almost invariably the fact. There is, however, a material difference in their fertility. The parts, which are lowest, are commonly the best; as being most frequently overflowed, and therefore most enriched by the successive deposits of slime. Of these parts that division, which is farthest down the river, is the most productive, as consisting of finer particles, and being more plentifully covered with this manure. In the Spring these grounds are almost annually overflowed. In the months of March and April, the snows, which in the Northern parts of New-England are usually deep, and the rains which at this time of the year are generally copious, raise the river from fifteen to twenty feet; and extend the breadth of its waters in some places a mile and a half, or two miles. Almost all the slime, conveyed down the current at this season, is deposited on these lands; for here, principally, the water becomes quiescent, and permits the earthy particles to subside. This deposit is a rich manure. The lands, dressed with it, are preserved in their full strength; and, being regularly enriched by the hand of nature, cannot but be highly valuable.

Nor are these grounds less distinguished by their beauty. The form of most of them is elegant. A river, passing through them, becomes almost of course winding. As the earth, of which they are composed, is of an uniform texture; the impressions, made by the stream upon the border, are also nearly uniform. Hence this border is almost universally a handsome arch, with a margin entirely neat, and very commonly ornamented with a fine fringe of shrubs and trees. Nor is the surface of these grounds less pleasing. The terraced form, and the undulations already mentioned, are both eminently handsome. In a country abounding in hills, plains moderate in their extent, like these, are always agree-

able. Their universal fertility makes a cheerful impression on every eye. A great part of them is formed into meadows. Meadows are here more profitable, and every where more beautiful, than lands devoted to any other culture. Here they are extended from five to five hundred acres; and are every where covered with a verdure peculiarly rich and vivid. The vast fields also, which are not in meadow, exhibit all the productions of the climate, interspersed in parallelograms, divided only by mathematical lines, and mingled in a charming confusion. In many places, large and thrifty orchards, and every where forest trees standing singly, of great height, and graceful figures, diversify the landscape. To all this I ought to subjoin, that, as these lands are not divided by enclosures on account of the annual floods, each interval appears, not as artificially fruitful, but as a field of nature, spontaneously producing all its vegetation, and originally furnished by the hand of the Creator, with all its beauties.

The whole quantity of these lands on the Connecticut cannot be conjectured. Probably they may amount to sixty thousand acres. They exist almost every where along its course; and are from a fourth of a mile to two miles in breadth. Single intervals contain from five to perhaps five thousand acres. They exist most extensively in Wethersfield, Hartford, Windsor, Glastonbury, East-Hartford, and East-Windsor, in Connecticut; in Long-Meadow, Springfield, Northampton, Hadley, Hatfield, Sunderland, Deerfield, and Northfield, in Massachusetts; in Windsor, Newbury, Lunenburg, and Guildhall, in Vermont; and in Charlestown, Haverhill, and Lancaster, in New-Hampshire. These lands also abound on the tributary streams, which empty into the Connecticut.

The Agriculture on this river may be regarded as a medium of New-England husbandry.

I am, Sir, yours. &c.

## LETTER VIII.

Inhabitants of the Connecticut Valley.

*Dear Sir,*

THE inhabitants of this valley may be said in several respects to possess a common character; and, in all the different States, resemble each other more than their fellow-citizens, who live on the coast, resemble them. This similarity is derived from their descent, their education, their local circumstances, and their mutual intercourse. In the older settlements most of the inhabitants are natives of this valley; and those, who are not, yield to the influence of a character, which they continually see all around them. In the more recent settlements, where greater numbers, and often a majority, were not born in this tract, the same character has regularly gained ground; and in most of them is already evident to an observing traveller.

Education, communicated by those, who have a common character, transmits its influence to those, who are educated.

I have mentioned, that their local situation contributed to the establishment of this similarity. They are so remote from a market, as to be perfectly free from that sense of inferiority, customarily felt by the body of people, who live in the neighbourhood of large cities. Hence a superior spirit of personal independence is generated, and cherished.

At the same time, people, who live on a pleasant surface, and on a soil, fertile and easy of cultivation, usually possess softer dispositions, and manners, and feel themselves entitled to a higher character, than those, who from inhabiting rougher grounds acquire rougher minds, and form coarser habits. Even the beauty of the scenery, scarcely found in the same degree elsewhere, becomes a source of pride, as well as of enjoyment.

Here all the older settlements, and a greater part of the more recent ones, are formed in villages. The influence of this mode of settlement I have elsewhere exhibited. It is here realized in

its fullest extent. Churches and suites of schools are built in them. Families have not only opportunity, but the most convenient opportunities, for being present at the public worship of GOD. Children also are sent universally at an early age to school ; and begin their education almost as soon as they can speak. In consequence of these facts, the inhabitants are better educated, and more orderly, than in most other parts even of New-England. There is no tract of the same size, in which learning is more, or more uniformly encouraged ; or where sobriety or decorum, is more generally demanded, or exhibited. Steadiness of character ; softness of manners ; a disposition to read ; respect for the laws, and magistrates ; a strong sense of liberty, blended with an equally strong sense of the indispensable importance of energetic government ; are all extensively predominant in this region.

The industry of these people is every where diffused, but less vigorous than among the inhabitants of the hills. In economy, hospitality, and charity, they are inferiour to those of no other tract of equal extent.

The towns in this valley are not, like those along the Hudson, mere collections of houses and stores, clustered round a landing ; where nothing but mercantile and mechanical business is done ; where the inhabitants appear to form no connections, or habits, beside those, which naturally grow out of bargains and sales ; where the position of the store determines that of the house ; and that of the wharf often commands both ; where beauty of situation is disregarded, and every convenience, except that of trade, is forgotten. On the contrary, they are villages, destined for the reception of men, busied in all the employments, existing in this country ; and usually contain a great part of the inhabitants in each township. The intention of settling in them is not merely to acquire property ; but to sustain the relations, perform the duties, and contribute to the enjoyments of life. Equally, and to my eye happily, do they differ from most European villages. The villages on the other side of the Atlantic are exhibited as being generally clusters of houses, standing contiguously on the street ;

built commonly of rough stone, clay, or earth, and roofed with thatch; without court-yards, or enclosures; and of course incapable of admitting around each house the beautiful appendages of shrubs, trees, gardens, and meadows.

New-England villages, and in a peculiar degree those of the tract under consideration, are built in the following manner.

The local situation is pitched on as a place in itself desirable; as a place, where life may be passed through more pleasantly than in most others; as a place, not where trade compels, but where happiness invites, to settle. Accordingly the position of these towns is usually beautiful. The mode of settlement is such, as greatly to enhance the pleasure intended. The body of inhabitants is composed of farmers; and farmers no where, within my knowledge, of a superiour character for intelligence, and good manners. The mechanics, the class next in numbers, have their full share of this character; and usually aim at a higher degree of respectability than in most parts of the country. Of both sorts a considerable number merit the appellation of gentlemen. A more than common proportion of men, liberally and politely educated, reside in the towns of this valley; and the pleasures of intellectual and refined society are here enjoyed to a considerable extent.

To this character of the inhabitants the manner of locating, and building, these towns is happily suited. The town-plat is originally distributed into lots, containing from two to ten acres. In a convenient spot, on each of these, a house is erected at the bottom of the court-yard; (often neatly enclosed;) and is furnished universally with a barn, and other convenient out-buildings. Near the house there is always a garden, replenished with culinary vegetables, flowers, and fruits, and very often, also, prettily enclosed. The lot, on which the house stands, universally styled the home lot, is almost of course a meadow, richly cultivated, covered during the pleasant season with verdure, and containing generally a thrifty orchard. It is hardly necessary to observe, that these appendages spread a singular cheerfulness, and beauty, over a New-England village; or that they contribute largely to render the house a delightful residence.

The towns in this Valley, taken together, are better built than an equal number in any other part of the United States ; unless perhaps on the Eastern coast of Massachusetts, where the wealth of the inhabitants is greatly superiour. Most generally they are built of wood ; and are neater, lighter, and pleasanter dwellings than those of brick, or stone. As they stand at a distance from each other, they are little exposed to fire, except from within ; and accordingly are very rarely consumed. Both they, and the public buildings, are usually painted white. No single fact except the universal verdure, and the interspersion of streams, contributes equally to the sprightly, cheerful appearance of any country.

In this Valley the principal Commerce of the country, within twenty miles of the river, is carried on ; and a great part of their mechanical business is done. Here the newspapers, circulated throughout this region, are printed ; and the bookstores kept, by which the inhabitants are supplied. Here also, the great body of information concerning this and other countries is first received, and disseminated ; and here fashions of all kinds are first adopted from abroad, and diffused throughout the vicinity.

In this region poverty, in its absolute sense, is scarcely known. Those who are here styled poor, possess usually both the necessaries and comforts of life. The paupers, maintained by the public, compared with the whole number of inhabitants, are probably not more than one out of three or four hundred. Every man, with hardly an exception, lives on his own ground, and in his own house. Every man, therefore, possesses an absolute, personal independence ; derived from his earliest ancestor, and secured by the government, under which he lives. It was born with him ; and therefore sits upon him easily, and naturally. The ancestor, from whom he derived it, he respects. The government, by which it is secured, he loves, and venerates, and is ever ready to defend. Life, here, is therefore seen in all its pleasing, rural forms ; and in these forms is seen with uncommon advantage.

The intercourse of the inhabitants is invited, and cherished, by all the facts already mentioned. To these may be added the

goodness of the roads, and the inns ; and the salubrity of the climate. The time has not been long passed since the roads on the hills were almost universally too rough to be travelled for pleasure. At that time the roads in this Valley were generally good, throughout a great extent. Hence the inhabitants were allured to a much more extensive intercourse with each other than those in any other part of New-England, except along the Eastern coast. For the same reasons a multitude of strangers have at all times been induced to make this Valley the scene of their pleasurable travelling. The effects of this intercourse on the minds, and manners, of the inhabitants I need not explain.

Beauty of landscape is an eminent characteristic of this Valley. From Hereford mountain to Saybrook, it is almost a continued succession of delightful scenery. No other tract within my knowledge, and from the extensive information which I have received, I am persuaded, that no other tract within the United States, of the same extent, can be compared to it, with respect to those objects, which arrest the eye of the painter, and the poet. There are indeed dull, uninteresting spots in considerable numbers. These, however, are little more than the discords which are generally regarded as necessary to perfect the harmony. The beauty, and the grandeur, are here more varied than elsewhere. They return oftener: they are longer continued: they are finished by a hand, operating in a superiour manner. A gentleman of great respectability,\* who had travelled in England, France and Spain, informed me, that the prospects along the Connecticut excelled those on the beautiful rivers in these three counties in two great particulars; the Forests, and the Mountains; (he might, I believe, have added the intervals also;) and fell short of them in nothing but population, and the productions of art. It is hardly necessary to observe, that both these are advancing with a rapid step (perhaps sufficiently rapid,) towards a strong resemblance to European improvement.

The first object, however, in the whole landscape is undoubtedly the Connecticut itself. This stream may perhaps with as much

\* The late Chief Justice Ellsworth.

propriety, as any in the world, be named the beautiful river. From Stuart to the Sound, it uniformly sustains this character. The purity, salubrity, and sweetness, of its waters; the frequency, and elegance, of its meanders; its absolute freedom from all aquatic vegetables; the uncommon and universal beauty of its banks; here a smooth and winding beach; there covered with rich verdure; now fringed with bushes; now crowned with lofty trees; and now formed by the intruding hill, the rude bluff, and the shaggy mountain; are objects, which no traveller can thoroughly describe, and no reader adequately imagine. When to these are added the numerous towns, villages, and hamlets, almost every where exhibiting marks of prosperity and improvement; the rare appearance of decline; the numerous churches, lifting their spires in frequent succession; the neat school-houses, every where occupied; and the mills, busied on such a multitude of streams; it may be safely asserted, that a pleasanter journey will rarely be found than that, which is made in the Connecticut Valley.

I am, Sir, yours, &c.

## LETTER IX.

Newbury—Observations on the blasting of wheat—Bradford—Fairlee.

*Dear Sir,*

ON Thursday, October 6th, we left Lancaster early in the morning; and rode to Bath through Dalton, Littleton, and Concord. The road, except the stony spot, which has been formerly mentioned, I found greatly improved, and substantially resembling those, which are in settlements long established. Dalton was much less advanced than I had imagined it must be: a natural consequence of its being, as is said, principally the property of two wealthy men, who are unwilling to sell their lands at such a price, as settlers are either inclined, or able, to give. Littleton wears a more promising aspect; and is extensively converted into farms. I found my former host, Mr. Williams, possessed of a large and good house, with very comfortable accommodations around him. His farm was extensively cleared, and cultivated; and it was not a little gratifying to see the spirit and industry, with which he had planted himself in a region, at that time so solitary and forbidding, crowned with such success. Indeed this region had lost the gloomy, discouraging appearance, with which it was invested in 1797. Concord also was very materially changed for the better; and Bath still more extensively. In this township we found an inn, better than most of those, of which the large towns on the shore can boast.

Since the date of this journey, the inhabitants of Bath have settled a respectable clergyman; a native of Scotland. Under his ministry they have become to a considerable extent superiour both in their character, and their circumstances, to the other inhabitants of this neighbourhood.

The next morning we left Bath, and rode to the ferry in Orford, through Newbury, Bradford, and Fairlee; all in Vermont. The River is here perhaps twenty-five rods in breadth, deep and of a brisk current. The boat was managed by two children,

smaller than I had ever seen trusted with such an employment. But the expedition and safety, with which we crossed the River, proved their perfect competency for the business ; and convinced me, that we generally estimate the capacity of children beneath the truth. Immediately below the ferry lies a remarkable Interval, extensively known in New-England by the name of the *Great Oxbow*, and still more extensively by the name of the *Lower Coos*. This is a peninsula, containing about nine hundred acres, and washed on three sides by the River, winding in the form of a beautiful bow. The isthmus, which connects it with Newbury, is about half a mile in breadth ; and the circuit of the bow about four miles. The whole extent is one vast meadow, covered with the richest verdure ; except a small tract, converted into arable ground ; and it is scarcely possible for mere earth to exhibit a more beautiful surface.

Newbury is a pleasant town in the North-East corner of the county of Orange, of which it is the shire town.\* It is built along the road from six to eight miles in a sparse manner, except at the centre ; where there is a small village. The houses, both in size and structure, are moderately good ; but not being painted, have an unpleasant appearance. The court-house, and church, exhibit nothing remarkable. The steeple of the latter was the first, which was erected in Vermont.

The soil in this township appears every where to be good. Formerly the Intervals, the plain immediately above them, (on which the town is built,) and the hills in the rear of the plain, all yielded wheat in abundance ; as did indeed almost every part of the country both above and below. For some time past this crop has been frequently blasted ; but I am informed that within two or three years these grounds have again yielded wheat under a new mode of cultivation.

The reason why the lands in New-England, which formerly yielded wheat surely and plentifully, suffer at the present time such injuries from the blast, as in a great measure to discourage farmers from attempting to cultivate it, has been anxiously and extensively

\* Danville has since been made the shire town.

sought for, but not it is believed, satisfactorily discovered. From my own observation, and enquiries, I have been induced to attribute this evil to the efficacy of animal manure. This subject has been already mentioned in my observations on the county of Worcester: it shall now be resumed.

The manner, in which wheat is generally blasted in New-England, appears to me very evidently to be this. During the months of June and July, when the kernels of wheat in the different climates of New-England are in the milk, the vegetation is far more rapid than in most countries of Europe. Whenever the season at this period is both moist, and hot, the rapidity becomes extreme. The vegetable juice, ascending then in too great quantities, and with a new celerity, moves with difficulty through the vessels of the stalk, regularly lessening towards the neck, and at that time so tender as to be easily ruptured, bursts them in various places; particularly at the neck; and flows out upon the surface of the stem. When it first exudes, it is very sweet to the taste; and has hence been commonly supposed to be the residuum of a particular kind of dew, called by the farmers *honey-dew*. Had any farmer recollected, what he cannot fail to find where he finds a honey-dew, that it never appears on any thing beside living-vegetables, and that, if it were a dew, it must be found equally on every other substance exposed to the atmosphere; he would certainly have determined, that it was merely the sweet juice of the vegetable itself. When this juice has pervaded the stalk, it soon becomes sour in the sun-beams; then so acrid, as to corrode the stalk; and finally a rust, (as it is commonly called,) of a brown hue, and an offensive smell.

Animal manure beyond any other accelerates vegetation. Wheat, nurtured by this manure, grows with so much rapidity, and with so tender a stalk, that in the agricultural language of this country, *it lodges* not unfrequently, (i. e. it falls under the pressure of wind or rain) by its own weight; and never recovers its original position. This dangerous process is peculiarly advanced by the use of this manure; and the rapidity of vegetation, otherwise too great, is by this substance rendered still greater. Hence

all fields, where this manure is employed, are peculiarly exposed to blast. For a few years after lands are dressed with it the evil is so evident to the eye of common observation, as to be not unfrequently believed to exist by some farmers, and suspected by others. Were every season hot, and wet, during this period, it would, I doubt not, have long since been generally realized, and acknowledged. But as in some seasons these months are cool and dry; and those fields which have been dressed with this manure, then yield wheat successfully; and as in the most unfavourable seasons; lands dressed in a different manner, are also subjected to the blast; the question has hitherto failed of any answer, which has been generally satisfactory.

The reasons, which have induced me to adopt the opinion here alleged, are principally the following.

I. All the lands in this country, which were not too wet, originally yielded wheat, easily, surely, and so far as they were rich, abundantly. The inhabitants of Northampton for many years paid their public tax in wheat; and this wheat grew on the very lands, where for a long period it has been supposed to be so uncertain an object of culture, as to be scarcely worth the attempt, i. e. on Intervals.

II. New lands yield wheat perfectly well in most parts of this country at the present time. Some farmers believe, that there is such a change wrought by time, either in the climate or in the soil, independently of the proper effects of culture, that the blast is to be attributed to this change. Although this is a mere supposition, supported by no evidence, it has still had its weight. But it is entirely refuted by the fact, mentioned under this head. Lands in the same circumstances yield wheat as abundantly at the present time, as at any former period. It deserves to be remarked, that all the Intervals along the Connecticut have furnished sure crops of this grain for a considerable time after they first began to be cultivated.

III. Lands dressed with ashes, now furnish fine crops of wheat, which is rarely or never blasted. The only reason why the crops on new lands are so safe from the blast, is that they

are covered with vegetable mould ; another name for vegetable manure ; and so long as the efficacy of this manure lasts, are dressed with no other. It is the universal tendency of this mould to produce great crops ; but it produces them by a gradual and moderate vegetation. Ashes, which are the same manure in another form, produce the same effect in exactly the same manner. Accordingly, although the crop of wheat, yielded by grounds dressed with ashes, is abundant ; yet the stalk is firm, and strong ; much stronger, but much shorter than that produced by animal manure, and equally safe from lodging, and blasting, as that, which grows on vegetable mould.

It ought to be observed, that in grounds, where the vegetable mould is very deep, and abundant, wheat grows so rapidly as to be universally blasted. That this effect is solely derived from the redundance of this manure is certain, because the same lands after the cultivation of a few years yield wheat perfectly well.

IV. In various instances, which have fallen within my knowledge, wheat, sown after clover, has been perfectly free from any injury by the blast ; and that on Intervals, and other lands most liable to this injury. Here vegetable manure has been employed in another form ; yet the same effect has been produced.

V. Lands, dressed with gypsum, have been equally favourable to wheat. This good effect has, however, been commonly produced through the medium of clover ; the gypsum having been first employed for the production of this plant, and the wheat having been sown after the clover had been ploughed in.

VI. Fields, manured with the white fish, have yielded wheat, universally, in great abundance, and with almost absolute certainty. This is indeed animal manure also ; but very different from that, which I have intended by this phrase above ; viz. that of the stable and barn-yard. The white-fish is a species of herring, very fat and oily, and remarkably favourable to vegetation of every kind, which is the object either of agriculture, or horticulture. I have mentioned this fact, to shew, that the evil, complained of, has its origin neither in the soil, nor in the climate ; but in the particular mode of cultivation, which I have mentioned as its proper cause.

VII. The lands in Pennsylvania, which yield plentiful crops of wheat, are regularly dressed with lime, or gypsum; and neither here, nor in those old settlements in the State of New-York, where this grain is least exposed to the blast, are cattle very numerous. Of course, the kind of manure, which I suppose to be noxious to this plant, cannot abound in these countries. I am informed also, that, where this manure is used, it is generally mixed with other substances in a *compost*; and converted, either partly, or wholly, into mould, before it is employed as a dressing. It ought also to be observed, that a great part of the wheat lands in these countries are clay; and that the process of vegetation may be therefore materially different from that, which exists in New-England, where the soil is principally loam, with a mixture of gravel. It is however said, that in Pennsylvania their crops fail, where they are unable to dress the lands with lime, or gypsum. It is also said, that the lands along the Mohawk river, which have heretofore yielded wheat with great certainty, as well as luxuriance, are gradually becoming less and less fitted for this kind of culture.

I have been informed that at Newbury they have lately adopted a new kind of husbandry, by means of which the crops of wheat are no less sure, and prosperous, than they were formerly. What this mode is, I have not, however, been able to learn.

In my own belief, animal manure produces this noxious effect long after it has ceased to enrich the soil. Although its influence has in this case become small; yet, so far as it extends, it is mischievous; and may at the dangerous period above mentioned accelerate a growth, at least sufficiently rapid otherwise, so as to produce the evil in question. Thus I consider grounds, long devoted to pasturage, as being injurious to the culture of wheat as really, though in a less degree, as those, which are manured from the stable in form.

It ought, however, to be observed, that, since the Hessian fly has rendered it impossible to cultivate what is here called *the white bald wheat*, we have lost the species, best fitted for the soil, and climate, of New-England, as well as that, which furnished the

best bread. All the substitutes for this wheat have yielded inferior crops ; have been more exposed to the blast ; have been more injured by the frost ; have weighed less ; and have been of an inferior quality.

Should these observations be allowed to merit the attention of farmers in this country, it would certainly be worth an experiment to see how far the use of vegetable, and mineral, manures would remedy this very serious evil. Were lands, intended for the culture of wheat, to be employed for this purpose during a considerable period ; were clover, or other vegetable substances, or, where they can be obtained, mineral manures, to be alone employed as the means of enriching the soil ; I am persuaded my countrymen would again see their crops of this grain not less sure, less abundant, nor less general, than they were in former times.

The people of Newbury appear to have cut down their forests with an improvident hand : an evil but too common in most parts of this country. Unhappily it is an increasing evil ; and may hereafter put a final stop to the progress of population, long before it will have reached to the natural acme. Almost every person complains of this imprudence ; and yet not a single efficacious, nor hopeful measure is adopted to lessen, or even to check it. A farmer, when employed in cutting down a grove, rarely remembers, that it will require thirty years to furnish on the same spot wood, fit for fuel ; and sixty, to yield that, which will become useful timber. As rarely does he recollect, that the boughs and branches, which he leaves to perish on the ground, would supply warmth to one or two indigent families. Forecast is certainly no predominant trait in the character of man : else an evil of this magnitude would create very serious apprehensions.

About the year 1782, a spring was discovered in this township, which, it is said, ceases to flow for some time, once in every two or three years. When its waters are left to settle, they are covered with a yellow pellicle ; and emit a strong sulphureous odour. No attempt, within my knowledge, has been made to use them medicinally.

The scenery, presented to the eye of a traveller, as he passes through this town, every where demands his observation. Among other fine objects, Moosehillock, or Moosheelock, is peculiarly interesting. This noble eminence ascends, as I should judge, not less than 4,500 feet above the level of the ocean ; and is probably higher than any mountain in New-England, except the White Mountains. Its form is majestic ; and the point of view, in which it is seen from this spot, is as advantageous as can be conceived.

Newbury contained in 1790, 873 inhabitants ; in 1800, 1,424 ; and, in 1810, 1,363.

Bradford is a continuation of the same soil and scenery. Along the road, it is inferiour in both respects to Newbury, but in the interior the soil is said to be particularly productive. It contains a small, pleasant village, built on a handsome plain, with a decent church in the centre.

Of Fairlee we saw very little, and nothing particularly interesting, except the fine bluffs, mentioned in the description of Orford. The soil is said to be inferiour to that of Bradford, and the surface of the interior to be rough and broken.

Bradford contained in 1790, 654 inhabitants ; in 1800, 1,064 ; and, in 1810, 1,302.

Fairlee contained in 1790, 463 inhabitants. In 1796 it was divided into two townships, named East and West-Fairlee ; the former of which contained in 1800, 386 inhabitants, and the latter 381. In 1810, both the townships contained 983 inhabitants.

From Fairlee we crossed to Orford on a neat bridge, consisting of one very obtuse arch, supported by trestles. This at the date of our journey, was the Northernmost structure of the kind on Connecticut river.

I am, Sir, yours, &c.

## LETTER X.

Keene.

*Dear Sir,*

WE left Orford on Saturday, October 8th, and rode to Dartmouth, where we continued until Monday morning. We then pursued our journey; and arrived at Charleston the same evening. On Tuesday, the 11th, we proceeded to Keene, through Walpole, and a corner of Surrey. The road, immediately from the village of Walpole, ascends a lofty eminence; a part of the chain of mountains, which passes on to the North from Mount Toby in Sunderland, and appears to blend itself with other spurs from the Lime range, North of the township of Claremont. At Walpole, this ridge is ascended with no other difficulty than what is derived from its height; the acclivity being sufficiently gradual to admit of the passage of waggons heavily loaded; but the height will always render the ascent very toilsome, and discouraging, to travellers. Nor is the descent very pleasant. Beside its vast length, it is in various places sufficiently steep to be uncomfortable. The summit, however, presents a very noble prospect. Immediately beneath the eye lies the Connecticut Valley on the West, and that of the Ashuelot on the East. The latter is about nine miles in length, and magnificently bounded by the range of Mount Washington, a long succession of lofty and varied eminences; far above all, which at the distance of twenty miles from the spectator ascends the conical summit of Monadnoc at the height of 3,254 feet above the level of the ocean. A finer object can scarcely be conceived; nor a position in which it could be more advantageously seen. Westward is spread the Connecticut, bordered by intervals on both sides, together with the cheerful villages of Walpole and Westminster, lying in a basin about nine miles in length, and terminated on the North by the Fall Mountain, a promontory of the boldest figure. Beyond the hills, which for eighteen or twenty miles form the Eastern division of Vermont in this quarter, as-

cends the Green Mountain range; an immense chain of magnificent elevations, gradually receding from the sight. Among these the mountain in Stratton, and Killington Peak are distinguished for their sublimity.

After we had ascended these hills, we found the road in the Valley, smooth, and agreeable.

Keene is very pleasantly situated on the tongue of land between the two principal branches of the Ashuelot. The Valley, in which it is built, extends, as we were informed, from North to South about forty miles in length. To the eye, in these directions, it is unlimited. The lands in this township are divided into hills, plains, and intervals; and are rich in all these varieties; yielding grass, flax, and every species of grain in abundance. Gypsum within a few years has been used on these grounds with a success, exceeding the most sanguine expectations. The intervals on both branches of the Ashuelot are extensive; and undoubtedly allured the first settlers hither at an early and dangerous period.

The town is chiefly built on three streets; the principal one running North and South; the others meeting it, but not crossing it, at right angles. At a little distance from the main street, Eastward, runs the Eastern branch of the Ashuelot: the other branch is somewhat more remote. Both are sprightly streams: and, while they furnish seats for various kinds of water-works, add not a little to the cheerful aspect of the surrounding region. The houses were generally neat; but in 1810 I found the town greatly improved by the addition of many new buildings; several of them in a very handsome style, and ornamented with elegant appendages.

Keene is the shire town of the county of Cheshire. The courts are alternately holden here, and at Charlestown. Both the church, and the court-house, are good buildings, and judiciously placed at the head of the main street. The inhabitants almost all belong to one Presbyterian congregation: a few are Methodists; and a few are Baptists. As a body, they have the reputation of being industrious, orderly, moral, and prosperous.

Keene has been long esteemed the prettiest village, as it is unquestionably the largest, in the Western parts of New-Hamp-

shire. At a subsequent visit, I thought it one of the pleasantest inland towns, which I had seen.

I lodged in the house of the Rev. Mr. H. the minister of the place. The spirit of Christianity, so generally and delightfully visible in the houses of almost all Clergymen in this country, and those of very many laymen also, was here rendered peculiarly agreeable by an unusual mixture of openness, simplicity, kindness, and candour. My reception was in a marked degree hospitable. The conversation was intelligent, cheerful, and evangelical; and the conduct of the whole family a happy exhibition of the christian character. Could licentious men once understand the nature of those emotions, which religion inspires in society, or even in solitude, they would hasten to partake of such a feast, and no longer satiate themselves upon garbage.

A part of the evening, accompanied by Mr. H. I spent in visiting the Rev. Mr. S——, the minister of Dublin; which lies about sixteen miles East of Keene. By many this gentleman would be styled a humourist. He has collected a considerable number of pictures, and other objects of curiosity; every one of which is either itself remarkable for some peculiarity, or connected with something else of the same nature, of which it was the memorial, or the illustration. With a vein of good sense, and considerable attainments in learning, Mr. S. unites, that peculiar cast of thinking, which sees most objects in a light, in which they are rarely, if at all, seen by others. This gives a characteristical novelty to his observations; and, added to a native and innocent sportive-ness, renders his conversation particularly agreeable. He is esteemed, and deservedly, a very worthy minister; and is eminently distinguished by his beneficence. Possessed of an independent fortune, he communicates the benefits of it very humanely, and liberally, to those around him. Particularly he has given \$5,000 to his parishoners, as a perpetual fund for the support of a Congregational Minister in Dublin. To this town he rides weekly; preaches on the Sabbath, and at other times occasionally; and performs all the duties of a clergyman. All this he does for a small salary; the chief part of which, and not improbably the

whole, he distributes in acts of charity. You will not wonder therefore, that he is greatly respected by the inhabitants of Dublin.

Mr. S. has purchased a house in Keene, for the purpose, as I suspect, of passing his declining days in intelligent and agreeable society. In this respect he bears a distant resemblance to the non-resident clergymen of England; and is the only person in New-England, of whom I ever heard, who approximated so nearly to this character.

The settlement of Keene began in 1738. From that time until the peace of Paris the inhabitants had their full share of Indian incursions. In 1745 the savages attempted to take by surprise a small fort erected here for the protection of the inhabitants. They were however discovered; and after a skirmish with the garrison thought it prudent to retire. They killed one man, took another, stabbed a woman, and burnt several buildings; in the ashes of which were found, partially consumed, many bones belonging to their own slain. In consequence of this attack the inhabitants of Keene and Swansey, or, as they were then called, of the Upper and Lower Ashuelot, and of Winchester also, deserted their habitations; and in 1747 they were chiefly burnt by the Indians. In the year 1755, when many of them had returned, the savages attacked the fort a second time. Their number was great; and the onset violent. But Captain Sims their commander, defended it with such gallantry and perseverance, that, after burning several buildings, killing the cattle, and destroying other property of the inhabitants, they withdrew. This was in June. In July they invaded the town again; but with little success: and this seems to have been the last incursion, made upon the Ashuelot.

Keene was incorporated in 1753; and in 1755 contained 756 inhabitants; in 1790, 1,314; in 1800, 1,645; in 1810, 1,646.

I am, Sir, yours, &c.

## LETTER XI.

Swansey—Winchester—The Ashuelot—Miller's River and Falls—Montague—  
Sunderland—Mount Toby—Cave.

*Dear Sir,*

ON Wednesday, October 13th, we rode through Swansey, Winchester, and Northfield, to the Canal in Montague. We lost our road soon after we began the journey; and in this manner made the distance about thirty-eight or thirty-nine miles; although in the direct course which lies along the Ashuelot it is not more than thirty-five. The country is level, and the road generally good.

Swansey is in every respect inferior to Keene; the soil, the cultivation, the houses, (a good number of which are decent,) and the prospects. The town, situated in the valley of the Ashuelot, where the expansion is about a mile in breadth, and the river bordered by some well appearing intervals, is rather a pretty settlement; and the inhabitants are apparently in comfortable circumstances. There are, also, along the road many good farmers' houses.

Winchester is not materially distinguished from Swansey by any thing, which was visible to us, except that the town, if it may be called such, consists of a much smaller number of houses, and those much better. Several of them exhibited a considerable degree of taste; and appeared as if they were the residences of polished people. At Winchester the Ashuelot turns almost at right angles from its general direction to the West. This river rises in the Sunnapee mountains, in Fishersfield; and running through Washington, Stoddard, the skirts of Westmoreland, Keene, Swansey, Winchester and Hinsdale, empties its waters into those of the Connecticut. Its length is not far from fifty miles. In Swansey, and Winchester, its current is slow; and its waters are deeply coloured.

Swansey contained in 1775, 647 inhabitants; in 1790, 1,157; in 1800, 1,271; in 1810, 1,400.

Winchester contained in 1775, 738 inhabitants; in 1790, 1,209; in 1800, 1,413; in 1810, 1,478.

From Winchester the road ascends the Eastern side of the range of Mount Toby. Both the ascent and the descent are steep and difficult; and the whole passage is disagreeable. On the Western side we were, however, presented with a spacious prospect of the Connecticut Valley, the river flowing through the midst of it, its fine Intervals, and the magnificent mountains, by which the valley is bounded.

The ride from Northfield to Miller's river in the border of Montague is very pleasant. The river is in full view throughout a great part of the distance. Immediately beyond it is a chain of elegant Intervals in the township of Gill. From these ascends a gradual, and very beautiful slope to the foot of Deerfield Mountain, here descending into a succession of hills of a very moderate elevation. Beyond these, in a valley of considerable length, by which the range is intersected, appears a handsome white church in a very picturesque situation. We crossed Miller's river on a bridge formed of a single arch. This stream, originally known by the name of Payquage, is one of the seven principal tributary streams of the Connecticut from the East. Its chief source is Monomenoc pond in the town of Rindge, in New-Hampshire. Hence it runs a South-Western course about thirty-five miles through the North-Western part of the county of Worcester, and the North-Eastern of the county of Hampshire, until it joins the Connecticut in the borders of Montague and Northfield. Immediately below the bridge is a fall, furnishing excellent mill-seats, which are occupied by several mills. These are uniformly supplied with an abundance of water, and wear the aspect of great activity, and business, particularly in the sawing of timber.

Almost immediately below the bridge, the road to the canal turns to the West through a forested pine plain; and proceeds in this direction about four miles: the distance, to which the Connecticut bends Westward in this quarter. We arrived at the place of our destination in the beginning of the evening, and found very indifferent accommodations.

The next morning we mounted our horses, and rode to Miller's Falls, about two miles higher up the river. These falls consist of two shelves; and a succession of rocks, commencing above the Northern shelf, extending below the Southern, and spreading through the interval between them. The whole bed is about eight miles in length; and is formed by the base of Deerfield mountain, which throughout this distance spreads across the river. The whole descent is sixty-two feet; and that at the principal fall fourteen. Here is erected a dam, seventeen feet in height, and nine hundred and seventy-two in length, built from the Eastern bank to the island, which is four rods in extent; and from the island to the Western bank. The Western direction of the river ceases, a little below the dam, where it turns again to the South; and after passing Greenfield bridge, a little more than two miles from the dam, bends again towards the East; and continues this direction till it reaches the general line of its current.

Just above the dam begins a canal, which is two miles and seven furlongs in length, and about twenty feet in breadth. It contains nine locks. The first, after the guard-lock, has a descent of six feet; the other seven, of eight feet, each.

These works were projected with sanguine hopes, and executed with great expense; but they have failed in a considerable measure of their intended effect. The dam was originally leaky; and cannot without great difficulty be thoroughly repaired. Hence, when the river is low, there is not sufficient water to fill the canal, and enable the boats to proceed. Besides, the dam is not high enough to cover with the back-water all the rapids above, nor sufficiently to slacken the current for the convenient passage of boats up the stream. The proprietors have, therefore, been obliged to build a second dam on the Northern shelf, about four miles higher up; which is also passed by a canal, with locks. This I did not see; and therefore cannot describe. The disappointment attending these works, and those at South-Hadley, has been a serious misfortune to the proprietors, and a source of not a little regret to the community.\*

\* I am informed, that all the defects, mentioned in the paragraph above, have been remedied.

The point of land, which fills up this arch of the river, became, soon after the erection of these works, a subject of speculation. A considerable piece of ground was bought here, laid out into house-lots, and destined to be the site of a considerable town. A few buildings were erected; and a few others begun, never to be finished. Happily the bubble broke almost as soon as it was blown; as a number of half-built, and already ruinous edifices testify. I was informed, that sanguine hopes were entertained of establishing here on a considerable scale both trade and manufactures. I should almost as soon have expected to see such establishments upon the beach, which borders the South shore of Long-Island. The soil is barren; the region solitary and desolate; and not a motive, either natural or adventitious, can be found within the limits of the horizon, to encourage adventure, or awaken expectation.

After having surveyed these works, we returned directly back to our road; and, passing through the limits of Montague, left it again to proceed to Shutesbury.

The township of Montague is naturally divided into the mountain: a part of the Mount Toby range on the East; a slope at its base, about two miles in breadth, and tolerably good land; and an extensive yellow pine-plain on the West, covered with a lean, miserable soil. It is distributed, so far as it is cultivated at all, into plantations.

Montague includes a considerable Congregation; and, in 1790, contained 150 houses, and 906 inhabitants. In 1800, the number amounted to 1,222; and, in 1810, to 934.

Immediately South of Montague lies Sunderland; a township, formed of a tract on Mount Toby, (a noble eminence about two miles East of the Connecticut;) a plain at its foot; and a considerable interval, commencing within the town plat, and extending several miles to the South. A part of the last division is good land: most of the rest is ordinary. The agriculture of Sunderland has been much improved within these few years by the use of gypsum.

The town is chiefly built on a single street, running parallel to the river. Its inhabitants are sober, orderly, moral, economical, and moderately industrious. It is improving in its appearance; but leaves on the mind of a traveller a strong sense of still and sequestered life.

Mount Toby is chiefly composed of Breccia, or Pudding-stone. The matrix is a thinly stratified sand-stone of a fine texture, moderately hard, and stained by iron, from a dull reddish brown to a rusty purple. The strata on the Western side decline towards the East; generally at angles with a horizontal line, varying from twenty to thirty degrees. The plums, or stones, embosomed by the matrix, are exactly of the same kinds, which are found every where in the earth adjacent; and are siliceous, argillaceous, or sand-stone. All of them are washed, and rounded, like the stones at the bottom of a stream, or on a beach of the ocean.

This mountain appears evidently to have undergone a violent shock. A numerous succession of fissures, either descending obliquely, or approximating to a horizontal direction, are for several miles visible on its sides. These are every where so posited, and figured, as to impress strongly on the mind a suspicion, that the mountain at some remote period settled down with a declension towards the North; and rent asunder in an infinite multitude of places the texture, which bound its several parts together. As you proceed from the town toward the North a few miles, there are seen, at the base, collections of rocks, lying in the most absolute confusion; as if shaken down from the side, or summit, by the convulsion, which dislocated the whole mass.

About four miles North of the town, there are still more striking proofs of such a convulsion. Here, on the ridge of the mountain, greatly inferiour, however, to the highest elevation, there is a cave, extending quite through. I visited it in 1790; and will communicate to you the result of my observations.

It is entered at the side, about thirty feet above the bottom. On the West the opening is barely wide enough to admit a large man without difficulty. Its depth, as I measured it with a cord, is seventy feet; the length, as measured by my steps, one hun-

dred and ninety-eight, or twelve rods. The breadth, which is greatest at the bottom, is, as I judged, from two feet to twenty. It is formed by two vast rocks, which seem to have been originally united, and were probably separated by the shock, mentioned above.

At the top we found a small aperture, about two feet wide, and about four long, formed by the washing away of the earth at the uppermost part of the rift, and here customarily called the window. By the same cause it will probably be increased in length hereafter. This chasm gives not the least perceptible light at the bottom of the cavern; nor would its existence be mistrusted, unless by a person looking upward from the spot, which is perpendicularly beneath.

After we had entered, the darkness, except a few feet around our torch, was perfect; and seemed as if it might be palpable. A silence, profound and drear, was interrupted only by the falling of drops of water from the sides of the cavern. These, derived from the condensation of vapour on the sides, descended as often as once in a second; and by the distinctness, with which they were heard, enhanced the idea of absolute silence beyond any conception, which I had before entertained. The gloom at the same time unchangeable, imagined not unnaturally to be eternal, and dimly illumined by the glare of the torch; the astonishing power, indicated by this rent of the mountain; and the wild and ragged appearance of the cavern; awakened in my own mind unmingled solemnity, and awe.

We left the cave by passing through the aperture on the Eastern side of the ridge; which is a little larger than that on the Western, and is about the same distance from the bottom. The ascent was easy and convenient. A few feet North is a large rift, here called the Ditch. Its length, as I paced it, is one hundred and thirty feet; its breadth at the top, ten; at the bottom three; and its depth, measured by a cord, forty-five; but, as there was snow at the bottom, the depth could not be exactly determined. The rock, which forms the Northern side of the cave, is the Southern side of the ditch. The whole combined appearance of

these rents presented to my own mind convincing evidence that the mountain has undergone a violent concussion.

When I visited this spot in October, 1806, I found its appearance materially changed. On the South side the rocks had fallen down in considerable numbers, and opened a new, winding, and disordered passage, or arm, if I may call it such, of the principal cavity, several rods in length. The window, according to conjecture, mentioned above, had become much larger. The earth, and stones, which had fallen from the two ends of the former aperture, had considerably raised the floor. In this manner the cavern had become comparatively light; and the gloomy grandeur, so awful and impressive, had in a great measure vanished. By a late mensuration, it is said the depth of the cave was found to be sixty-five feet, and that of the ditch forty-five.

The pudding stone, of which this mountain is so extensively composed, extends to Hinsdale; near thirty miles. On the North side of a mill-stream, which enters Connecticut river in Northfield, I found a mass of this stone in a state of decomposition. A considerable part of it had already become earth. Other parts were so friable, as to be easily pulverized between the fingers. Others still were harder, in successive degrees, until they reached a perfect state of induration. The stones, imbedded in this matrix, are of every rounded form, very various in their colours, and of every size from a tenth of an inch to a foot. Out of the softer parts of the matrix I took without any difficulty several small stones; each of which left a smooth mould, exactly of its own form; proving that the matrix was a mere enclosure, and never united to it by any sensible cohesion.

Sunderland includes a single congregation. In the year 1790, the number of its dwelling-houses was 73, and of its inhabitants 462. In 1800, the number of houses was 74, and of inhabitants 537. In 1810, the number of inhabitants was 551.

I am, Sir, yours, &c.

## LETTER XII.

Shutesbury—Ephraim Pratt—Amherst—Judge Strong.

*Dear Sir,*

IN our journey to Shutesbury we rode through a country, rough, lean, and solitary ; lying principally on the range of Mount Toby, and the hills, which connect it with that of the White Mountains. The inhabitants were few, and thinly scattered. Generally, also, they were in poor circumstances, and without any apparent hopes of advancing to better. Their houses were bad in most instances, their inclosures very imperfect, and their cultivation wretched. This tract, before it reaches the borders of Shutesbury, may lie partly in Montague, partly in Sunderland, and partly in Leverett.

The object of our journey to Shutesbury was to see a man, named Ephraim Pratt, very far advanced in age. The distance is ten miles. We arrived late in the afternoon, and found the object of our curiosity.

He was born at Sudbury (Massachusetts) in 1687 ; and in one month from the date of our arrival (Wednesday November 13th) would complete his one hundred and sixteenth year. He was of middle stature ; firmly built ; plump, but not encumbered with flesh ; less withered than multitudes at seventy ; possessed of considerable strength, as was evident from the grasp of his hand, and the sound of his voice ; and without any marks of extreme age. About two months before, his sight became so impaired, that he was unable to distinguish persons. His hearing, also, for a short time had been so imperfect, that he could not distinctly hear common conversation. His memory was still vigorous ; his understanding sound ; and his mind sprightly in its conceptions.

The principal part of the time, which I was in the house, he held me by the hand ; cheerfully answered all my questions ; readily gave me an account of himself in such particulars, as I wished to know ; observed to me, that my voice indicated, that I

was not less than forty-five years of age ; and that he must appear very old to me : adding however, that some men, who had not passed their seventieth year, probably looked almost, or quite, as old as himself. The remark was certainly just ; but it was the first time, that I had heard persons, who had reached the age of seventy, considered as being young. We were informed partly by himself, and partly by his host, that he had been a laborious man all his life ; and particularly, that he had mown grass one hundred and one years successively. The preceding summer he had been unable to perform this labour. During this season his utmost effort was a walk of half a mile. In this walk he stumbled over a log, and fell. Immediately afterwards he began evidently to decline ; and lost in a considerable degree both his sight and hearing. In the summer of 1802, he walked without inconvenience two miles ; and mowed a small quantity of grass.

Throughout his life he had been uniformly temperate. Ardent spirits he rarely tasted : cider he drank at times, but sparingly. In the vigorous periods of life he had accustomed himself to eat flesh, but much more abstemiously than most other persons in this country. Milk, which had always been a great part, was now the whole of his diet. He is naturally cheerful, and humorous ; apparently unsusceptible of tender emotions ; and not much inclined to serious thinking. According to an account, which he gave his host, he made a public profession of religion near seventy years before our visit to him ; but was not supposed by him, nor by others acquainted with him, to be a religious man. He conversed easily ; and was plainly gratified with the visits, and conversation, of strangers. When he was ninety-three years old, he made a bargain with his host, (who told us the story,) that he should support him during the remainder of his life for £20.

He was never sick but once ; and then with the fever and ague. It is scarcely necessary to observe, that a man one hundred and sixteen years old, without Religion, was a melancholy sight to me.

Three or four years before this time I saw in a newspaper an advertisement, written by a person, who professed, and appeared, to be acquainted with him, and his concerns, in which it was said,

that his descendants, some of whom were of the fifth generation, amounted probably to more than 1,500.

Shutesbury lies on the Western side of the Lyme range. The surface is not very uneven, but encumbered with rocks and stones. The soil, so far as we had opportunities to see it, is moist, and of an indifferent quality. The houses on our road were poor, and the cultivation, bad. We passed through the skirts of the township. In the centre, we were told, every thing wore a better appearance.

In 1790 Shutesbury contained 117 houses, and 674 inhabitants. In 1800 the number of inhabitants was 930; and in 1810, 939.

We rode from Shutesbury to Amherst in the evening; and had therefore a very imperfect opportunity of surveying the country. So far as I was able to examine it before the darkness came on, which was about half the distance, it grew continually better in surface, soil, and appearance.

The next morning we ascended the tower of the church, to take a view of the third great expansion in the valley of the Connecticut. The position is a very eligible one for this purpose; commanding a great multitude of the fine objects, which are visible from the summit of Mount Holyoke. That part of the expansion, which is South of Sugar-loaf, assumes here the form of a regular, elliptical amphitheatre. On the North-East it is bounded by the mountains of Pelham, high elevations in the Lyme range; and on the South-West by Pomeroy's mountain; a striking eminence on the Western ridge of the Green Mountain range. This amphitheatre is about twenty-four miles in length, and about fifteen in breadth. The mountains, by which it is encircled, and the varieties of scenery, with which its area is filled up, form one of the most impressive and delightful objects, which can be found in this country.

In this fine collection of scenery the township of Amherst holds no inferior place. A handsomer piece of ground, composed of hills and vallies, is rarely seen; more elegant slopes, never. The lines, by which they are limited, are formed by an exquisite hand, and with an ease and grace, which art cannot surpass. An agreeable

view of this configuration of elegant surface is taken from the great road, which crosses the Southern border of the township, under Mount Holyoke. The soil, is uncommonly rich; and produces every thing, which will grow in this climate. The agriculture also is good: and the inhabitants, as a body, are in easy circumstances. Their houses are good farmers' habitations.

In the year 1790, Amherst, which consists of two parishes, contained 176 dwelling-houses, and 1,233 inhabitants; and in 1800 the number of inhabitants was 1,358; and in 1810, 1,469.

In Amherst lived the Honourable Simeon Strong, one of the Judges of the Supreme Judicial Court in Massachusetts. This gentleman was born in Northampton, in 1735, of respectable and virtuous parents. He was educated at Yale College; where he took the degree of A. B. in 1756. As a scholar he was distinguished both for learning and science; and for his acquaintance with the Greek and Latin languages obtained the Berkleian premium. In early life he devoted himself to the preaching of the Gospel; and pursued the employment several years with much reputation. Pulmonary affections, however forced him to relinquish it; and induced him to turn his attention to the study of law. In this profession he was educated by the Hon. John Worthington of Springfield, respectfully mentioned in a former part of these letters. At the bar he rose deservedly to the first rank of advocates; and might be said with truth for many years to be engaged in almost every important cause in his native county, and in many in those of Worcester, and Berkshire. His knowledge of law was profound and comprehensive; his discernment remarkably active; and his reasoning faculties eminently vigorous. He was a metaphysician by nature; possessing the peculiar discrimination, attached to that name; yet he possessed such a fund of common sense, as effectually prevented him from pursuing the wiredrawn subtilities so generally relished, and adopted by men, who have worn this name.

In Mr. Strong, metaphysical genius was directed to no other end, than the advancement of useful purposes; and was employed, only as an auxiliary in rendering his ratiocination acute, exact,

and conclusive. Few men had higher powers of this description; and few, who have had them in the same degree, have used them with the same wisdom.

His imagination, also, was vigorous and brilliant. His wit, always ready, and occasionally scarcely less decisive than his reasoning, with respect to the objects, which it was intended to accomplish, was employed only for such purposes, as were dictated by benevolence, and approved by a sound understanding. Probably no instance can be remembered, in which he ever uttered a sentence, to display himself, or unnecessarily to give pain to others.

Whatever he had occasion to investigate he studied thoroughly. I have observed, that he was a profound lawyer; his favourite science however, was Theology. In the knowledge of this science he was excelled by few men. He loved the bible, and studied it intensely through his life. The doctrines, which he held, were those of the Reformers; and these he held with great firmness, but with great candour, without bigotry, with a distinguished spirit of moderation, and with a modesty not less distinguished. No man could converse with him to any extent on religious subjects without improvement.

Several years he was a member of the Legislature as a representative, and afterwards as a senator. In the year 1800, he was appointed one of the Judges of the Supreme Judicial Court, and continued in this office till his death. The University at Cambridge conferred on him the degree of Doctor of Laws, in the year 1805.

The Moral character of Judge Strong was of the first class. I was long and intimately acquainted with him, and with multitudes of those, who lived around him. I know not, that an unwise or censurable thing has been laid to his charge. He seems to have determined on nothing, and to have done nothing, which he had not well considered, and which he had not brought for trial to the Evangelical standard of rectitude. His "wisdom dwelt with prudence:" and, although as a man he undoubtedly had his errors, and his faults, yet they seem to have escaped the public eye.

On his integrity, all who knew him, relied without a suspicion. His sense of the importance of truth, justice and benevolence, was controuling ; and his exhibition of these virtues in his life was such, as acquired him the highest esteem. Nor was his piety less uniform, or less undoubted.

In the various relations of private life he shone with a mild and delightful lustre ; and its offices he performed with a cheerfulness, regularity and amiableness, which it is difficult directly to describe, or sufficiently to praise.

His manners were an unusual mixture of gravity and cheerfulness, of simplicity and propriety, of modesty and dignity. To me, and I presume to all his acquaintance, they were uncommonly agreeable ; less polished and graceful than those of men, in the fashionable sense, well bred ; but much more agreeable than the manners of most such men ; such as did not exhibit the polished citizen, but such as presented an intelligent being with high advantage.

Judge Strong died December 14th 1805, in the 70th year of his age. The religion, which he had professed, and lived, so long, gilded his exit with the calm sunshine of a summer evening.

The character of this gentleman has been drawn with great felicity by a masterly hand in the Panoplist for March 1812. In the concluding paragraph the writer says,

“The judicious reader will doubtless be of the opinion, that the subject of the preceding notice is justly to be ranked among the worthies, whose useful attainments, and disinterested virtue, will long shed a lustre on the page of our history. “Happy the man,” he will exclaim, “who devotes a long and prosperous life to the service of God, and the good of mankind. Happy the people who have the wisdom to choose such men to be their rulers.”

On Friday, the 14th we rode to Hadley, and on Monday proceeded towards New-Haven ; where we arrived the Wednesday following.

I am, Sir, yours, &c.

# JOURNEY TO VERGENNES.

## LETTER I.

Woodbridge—Salem—Waterbury—Watertown—Litchfield—The Late Governour  
Wolcott—Goshen—Cornwall—Canaan—Sheffield—Taghkannuc Mountain—  
Great-Barrington—Monument Mountain—Stockbridge—Rev. John Sargeant—  
Mohekaneew or Stockbridge Indians—Tradition concerning their origin &c.—  
Lenox—Pittsfield—Lanesborough—New-Ashford.

*Dear Sir,*

MONDAY, September 16th, 1798, I set out on a journey to Vergennes, in company with a young gentleman ; and rode to Waterbury : twenty-three miles. The road, which passes through the township of Woodbridge, and through Salem, the Southern parish of Waterbury, was for the first seventeen miles a turnpike road ; laid over a rough country with unusual skill and judgment. It is not incommoded by a single disagreeable ascent, or descent.

West-Rock, formerly mentioned, a narrow valley beneath it, and a collection of hills still further West, form the township of Woodbridge. The soil is generally good grazing land, and some of it excellent. It is wholly composed of farms ; the proprietors of which, are, generally, in easy, thriving circumstances, and some of them wealthy. The people are industrious, sober ; and generally harmonious, peaceful, and orderly. This township contains excellent slate in abundance. Limestone also, and coal, have been discovered here in small quantities. Coal is believed to abound.

Woodbridge contained, in 1790, 2,124 inhabitants ; in 1800, 2,198 ; and, in 1810, 2,030.

Salem lies on Naugatuck river. This stream rises in Norfolk, near the Northern boundary of the State ; and, passing through Winchester, Torrington, Harwinton, Plymouth, Waterbury, Ox-

ford, and Derby, joins the Hooestennuc near the Southern limit of that township. Its length is not far from sixty miles.

The lands in Salem, except a chain of intervals along the Naugatuck, of no great extent, are moderately good. The hills are high, and, what is uncommon in New-England, are dry also. The scenery along the river is romantic.

Thirteen miles from New-Haven the hills, bordering the valley of the Naugatuck on the East, separate suddenly, and form a gap of a width just sufficient to allow a passage for the road, and for a lively brook, which murmuring for a considerable distance by its side, enlivens the wild and gloomy scenery. But for this chasm a practicable passage could scarcely be made from Salem to New-Haven.

The houses in this parish are moderately good. The inhabitants have long suffered in their morals and their peace, from unhappy divisions.

From Salem to Waterbury our road lay along the Naugatuck; and was sufficiently level, but stony, and disagreeable. A new one has been since made in the turnpike manner, from the Litchfield road, in Salem, to the North line of the State; which, passing through Waterbury, runs along the banks of the Naugatuck, almost to its source. This road is said to be a good one.

Waterbury is a pleasant town, built chiefly on a single street. Its site is a plain, which borders the intervals on this river, and extends to the foot of a range of hills on the East. The expansion here is about two miles wide; and the intervals about one fourth of a mile. These grounds were the real cause of the settlement of this town. In the year 1673, some persons in Farmington petitioned the Legislature, that a Committee might be appointed to examine the country about Mattatuck; the Aboriginal name of this spot. The Committee was appointed; and the members of it are praised by the State records, as having with great courage and fortitude surmounted the hazards, and difficulties, attendant upon their journey. The grave manner, in which this subject is mentioned by so solemn a body as a Legislature, would naturally lead one to suppose, that the Commissioners

were sent upon a very arduous enterprise. The distance from Farmington to Waterbury is not more than fifteen miles : and the intervening country, though partially mountainous, presents no gigantic difficulties in the way of such an expedition. As the Commissioners went voluntarily, it is rationally supposed, that no serious troubles were expected from the savages. Yet, for reasons which perhaps cannot now be divined, the expedition was by the Legislature esteemed difficult, and dangerous ; and the accomplishment of it deserving of honourable mention.

The Commissioners made a report in 1674 ; in which they stated, that there was land enough in Mattatuck to support about thirty families. By land they obviously meant intervals : the only division of the surface, which our ancestors considered as deserving of this title. The Commissioners therefore supposed that on these intervals only thirty families could live. Their examination however must have been very imperfect ; for the intervals in the original township of Waterbury would support several times this number. Within that township, which included Watertown and Plymouth, there were, in 1800, near 7,000 inhabitants.

The planters first seated themselves on the Western side of the river, but, perceiving the freshets frequently to rise so high, as to render it impassible, they rationally concluded, that the situation was unsafe : for if the Indians should attack them during the time of a flood, they would be able neither to obtain assistance, nor to secure a retreat. They therefore removed to this spot : on all other accounts more desirable than the former. The town is generally decently built ; and contains several neat houses, and two well-appearing churches : a Presbyterian, and an Episcopal. A few years since, an academy was erected there ; but it is now visibly decaying.

The morals of this town are not on a high scale.\* Beside the usual evils of political division, litigation has, for a long time, spread a malignant influence over the people of Waterbury. Its well known effects have been extensively suffered here ; and will in all probability be unhappily realized to an indefinitely future period.

\* 1798.

Several manufactures have been carried on in this town with spirit and success; particularly that of clocks, principally formed of a particular species of wood. These are considered as keeping time with nearly as much regularity, as those which are made of the customary materials. They also last long: and being sold at a very moderate price, are spread over a prodigious extent of country, to the great convenience of a vast number of people, who would otherwise have no means of regulating correctly their various business. Gilt buttons also have been made here in considerably quantities; not inferior in strength and beauty to those which are imported.\*

In several townships, in the Western parts of this State, are scattered a number of families, whose names declare them to be of Scottish extraction. I have long wished to learn when, and by what means, these families were thus interspersed among the English Colonists.

Waterbury was settled in 1685; and included, at the date of this journey, the parishes of Middlebury, Salem, and a part of Columbia. The number of the inhabitants was, in 1756, 1,802; in 1774, 3,536; blacks 38; Plymouth and Watertown included. In 1790, exclusive of Watertown and Plymouth, Waterbury contained 2,937; in 1800, 3,256; and, in 1810, 2,874.

At the period last mentioned, Middlebury having been incorporated as a township, is not included. The number of the inhabitants of Middlebury, at this time was 847. In these several parishes there are four Presbyterian, and two Episcopal, Congregations: one of the latter a plurality.

Tuesday, September 18th, we rode from Waterbury to Litchfield: sixteen miles. The road for the first five miles is rough; the remainder is the turnpike first mentioned above.

Watertown is a township of rich land, and an uneven surface; pleasant; and every where spotted with beautiful groves. For a mile below the town, and some distance above it, extends an elegant chain of rich meadows, bordering the sides of a sprightly

\* Since this was written, several other manufactures have been established in Waterbury.—*Pub.*

stream. Even in this season of drought, these fine lands were vivid with a beautiful green. On a rising ground upon their Western border stands the town; containing two churches and a number of very decent houses. One of the Congregations is Presbyterian, the other Episcopal.

The soil of this township is a reddish brown loam, and suited to every production of the climate.

In 1790, its inhabitants amounted to 3,170; (Plymouth included;) in 1800, to 1,615; in 1810, to 1714. In 1800, Plymouth contained 1,791; in 1810, 1,882.

Immediately above Watertown lies South-Farms; the Southern parish of Litchfield. This parish is principally a collection of hills, which are high, moist, and excellent grazing ground. The surface is pleasant; the houses good farmers' dwellings; of which a little village is formed around the church. The inhabitants are industrious, and thrifty; and distinguished for good morals, good order, and decency of deportment.

A flourishing Academy has been raised up, here, almost solely by the efforts of James Morris Esq. who is at once its founder and preceptor. This gentleman, soon after he had finished his education at Yale College, became an officer in the American army, in which he continued throughout the Revolutionary war. After the peace, his parents, and his patrimony, being in this place, he was induced to establish himself here for life. At his return he found the inhabitants less enlightened, and less refined than those of many other parts of the State. What in this country is perhaps singular, they regarded him, both as a man liberally educated, and as an officer, with suspicion, and alienation. At the same time he perceived, with not a little mortification, that they were in many instances ignorant, and vicious. As he had been absent from his early youth; his influence among them was to be created. With a disposition, which scarcely can be enough commended, he determined to commence in form the work of a general reformation. After various experiments, sufficiently discouraging, among those who were arrived at middle age, he turned his attention to their children; and hoped by communicating to

them the advantages of a well-directed education to furnish their minds with both knowledge and virtue, and thus to transform their character into amiableness and worth. For this benevolent purpose was founded the institution which, I have mentioned.

In this Academy it has from the first been the commanding object to inculcate the best principles of morality and religion, and to require of the students an unexceptionable deportment. The youths of both sexes, usually assembled here from various parts of the country, are in number from forty to seventy.

Mr. Morris\* has had the satisfaction of seeing his expectations more than verified. Not only were the benefits of his design realized by the inhabitants of South-Farms, but they were spread also through most parts of the County, and extensively through this and the neighbouring States. This is one, among the proofs furnished by experience, of the power, possessed by an individual, of spreading around him, when happily disposed, the best blessings of society.

Litchfield is a handsome town; situated on an easy, beautiful slope, scarcely declining from North to South, and descending a little more rapidly to the East and to the West. It is chiefly built on two streets, crossing each other in the centre at right-angles. The houses are well built; and the Court house is handsomer than any other in the State.

There are two Congregations, a Presbyterian, and an Episcopal. The latter has three churches; one, standing in the centre of the town, a decent building, but unfinished; the second, about a mile Westward, a pretty building; the third, still farther West, old and ill repaired. It is probable, that the Congregation will find this train of churches an unpleasant encumbrance; particularly as they were not harmonious in the business of erecting the two, which have been last set up.

The aspect of the country around Litchfield, as seen from the town, or, as it is frequently called, the Hill, is uncommonly handsome; consisting of open extensive vallies, hills gracefully arched, rich hollows, and groves formed of lofty trees, interspersed

\* This excellent man died in 1820.—*Pub.*

every where at the most pleasing distances. Towards the South-West, especially, are these beauties concentrated upon the sides, and in the bosom, of a spacious valley ; which presents itself in the fairest view, together with a collection of good farmers' houses, luxuriant fields, and flourishing orchards. This valley is ornamented with two pieces of water. One of them, commencing about three miles from the Hill, and spreading itself three miles farther in a South-Western direction, winds from the eye, so as to resemble the noble meanders of a great river. In the back ground of the landscape ascends Mount Tom ; a conical eminence, overlooking all this elevated country, and rising, as is supposed, about one thousand five hundred feet above the level of the ocean.

A respectable female Academy has for many years been established here, under the superintendence of Miss Pierce. In this school a great number of students both from Connecticut and the neighbouring States have been taught the knowledge, and accomplishments, furnished by similar institutions.

Litchfield is distinguished for the intelligence of many of its inhabitants, of both sexes : and few towns in Connecticut have seen more of their citizens employed in honourable public offices.

Among these gentlemen, His Excellency Oliver Wolcott, deserves to be particularly mentioned. This very respectable man was born in Windsor, in the year 1727 ; and was the youngest son of the Hon. Roger Wolcott, formerly Governor of the Colony of Connecticut. He was graduated at Yale College in 1747. Soon after his education was finished, he became an officer in the military service, against the French in Canada. After retiring from the service, he began the study of physic ; but quitted it in consequence of being appointed High Sheriff of the County of Litchfield. When he gave up that office, he was appointed Chief Judge of the Court of Common Pleas. For many years he was a Member of the Council, and afterwards of the original American Congress ; where, in 1776, he strenuously urged the Declaration of Independence. Afterwards, as a Major General, he commanded a body of levies in the Revolutionary war. In 1786,

he was chosen Lieutenant Governour, and, in 1796, Governour of Connecticut. He died, December 1st, 1797, in the 72d year of his age. With this gentleman I was familiarly acquainted. He was remarkably distinguished for intrepidity, firmness, incorruptible integrity, strong, bold conceptions, and a peculiar decision of character. At the same time, his sensibility was quick, and exquisite. The sight, or even the narration, of a mean, a dishonest, or an ungenerous, action, appeared to give him a chill, and changed his countenance. The emotions, which these things excited in his mind, he could not conceal; and at times he expressed them in terms singularly forcible and vivid. Towards every thing of this nature, he not only exercised the reprobation of offended virtue, but felt the disgust of wounded delicacy, and that instinctive abhorrence, with which a generous mind shudders at the approach of what is base and pitiful. So far as a life unimpeachable, and fraught with benevolence and sincerity; so far as sound and superiour wisdom; so far as a disposition always to oblige, and manners in an eminent degree gentlemanly: could recommend a man to the public, Governour Wolcott was popular.

Yet his character, and conduct, furnished more themes of declamation, and obloquy, to those, who were willing to be his enemies, than the conduct of men, whose feelings are more blunt, and more easily concealed. His public and private life was unexceptionable. In his conduct he was not only upright, but eminently prudent. He could not yield to popular impulses, even in cases, where he might have yielded without wounding his conscience, or committing his principles. In the vicinity lived some artful and mischievous men. These, to promote their own sinister designs, not only picked up those facts, and observations, which they thought might injure his reputation in the State, and distorted them in such a manner, as to promote their own purposes; but fastened upon his character such others, invented by themselves, as they hoped, and sometimes found, would gain credit with the populace, from the unbending, open firmness of his life. Their successes were however limited, and pitiful. By the wise and good men in his own country, Governour Wolcott was held in unsha-

ken and most honourable estimation. Accordingly he was raised to every office of distinction, which it was in their power to confer, and died in the highest seat of magistracy.

For a great number of years he was a professor of the Christian religion : and his life adorned his profession. For several days before his departure, says the Rev. Dr. Backus, in a sermon preached at the funeral of this excellent man, "Every breath seemed to bring with it a prayer ; till at last he fell asleep."

In Litchfield there is established an excellent Law school. This institution was formed many years since, and has been hitherto superintended, by the Hon. Tapping Reeve, one of the Judges of the Supreme Court of Connecticut. A regular system of lectures, and other instructions, are here given by this gentleman, and by James Gould, Esq. Counsellour at law in this town. The students are also employed in discussions of law questions, and in arguing cases. The number of students is about forty.

Litchfield includes four parishes, and five Congregations ; the two, which have been already mentioned, and the Congregations of South Farms, Milton, and Northfield. In 1756, this township contained 1,366 inhabitants ; in 1774, 1,554 : 45 blacks ; in 1800, 4,287, and in 1810, 4,639.\*

In the afternoon we proceeded to Goshen ; the township immediately North of Litchfield. The road was stony and bad : the distance seven miles. A turnpike road has been since made which has reduced the distance to six miles, and rendered the travelling pleasant. The next day we proceeded to Canaan. The afternoon was intensely hot, and much more uncomfortable on account of copious exhalations from the surface, produced by a heavy rain, which fell during the former part of the day.

Goshen, like Litchfield, is situated on the Green Mountain Range. The elevation is lofty ; probably little less than one thousand feet above the surface of the ocean. The aspect of the township is much less beautiful than that of Litchfield, and

\* Litchfield is remarkably distinguished for salubrity of climate. I am informed that no fever has ever prevailed in it to any great extent although it has been settled ninety-five years.

yet in many places is handsome; being formed of easy slopes, and open vallies. It is, perhaps, the best grazing ground in the State: and the inhabitants are probably more wealthy, than any other collection of farmers in New-England, equally numerous. The quantity of cheese, made by them annually, is estimated at four hundred thousand pounds weight. Butter is also made in great quantities. The houses are good farmers' houses. There are a few in a superiour style. The inhabitants are distinguished for industry, sobriety, good order, and good morals.

Goshen includes only one Congregation. In 1756, it contained 610 inhabitants; in 1774, 1,111: blacks 13; in 1800, 1,493; and, in 1810, 1,641.

The wealth of Goshen is one proof of the superiority of grazing ground to that, which is devoted to tillage.

Below Litchfield the forests are universally oak, hickory, &c. In Goshen they are composed of maple, beach, hemlock, &c. The first white pines which we saw on this road, were in Goshen.

The granite country in New-England, reaches, I believe, every where to the Western ridge of the Green Mountains. I have crossed them in a variety of places; and have travelled along their Western border, almost throughout their whole length. Wherever I have had opportunity to observe them, this is the fact. There is, indeed, almost every where a numerous interspersion of stones, and rocks, of various kinds; but granite predominates. It is usually a light grey. I have seen it white; striped with red; and in some instances of a contexture so well compacted, as to admit of a good polish. From this line, almost a meridional one, the limestone country commences; and continues as far West at least as Lake Erie: not, however without some considerable interruptions by slate, and some, even by granite. On the Western summit of these mountains, in Goshen, the limestone is mixed; at the bottom, it is white and pure.

Goshen is remarkable beyond any other town in the State, except perhaps Norfolk and Colebrook, for frequent and copious falls of snow. The distance from Litchfield is but six miles; and

the increase of elevation very small. Yet snow falls not unfrequently in Goshen, when it rains in Litchfield. On the 10th of October, 1804, it fell here twelve inches deep : while at Batavia, in the County of Genesee, and State of New-York, where I then was, it did not whiten the ground at all. Yet Batavia is not far from sixty miles Northward of Goshen. Snow is also deeper here, and continues longer, than in most other places under the same parallel.

Cornwall, through a skirt of which we passed when we left Goshen, is generally considered as the roughest township in the State : being made up of mountains of considerable height, and their intervening vallies. Through one of these vallies our road descended from Goshen. It is formed by a deep indent in this range ; into which we descended rapidly for the first two miles, and gradually several more. At the head of the valley we looked through a long and magnificent vista, terminated by two promontories, which abut upon it with a bold precipitous grandeur, into an expansion on the Hooestennuc, comprehending a part of the townships of Salisbury, Canaan, Sheffield, Mount Washington, and Egremont. This interesting prospect was limited by Taghkonnuc on the North-West ; the loftiest eminence but one, in the State of Massachusetts. The valley is every where romantic. A sprightly brook murmurs at the bottom, which is speedily swollen into a mill-stream. Several groves of white pine rise upon its borders.

Cornwall has a drier and warmer soil than Goshen ; and yields wheat plentifully. It contains two congregations. The number of its inhabitants, in 1756, was 500 ; in 1774, 977 : ten of them blacks, and seven of them Indians ; in 1800, 1,614 ; and, in 1810, 1,641.

Canaan, like Cornwall, has a very irregular surface : being partly composed of an extensive plain ; partly of intervals, bordering the Hooestennuc, and two of its tributaries ; and partly of hills, mountains, and vallies. The soil, taken together, is not above mediocrity. It yields wheat, when sufficiently rich, abundantly. On the plain, peach trees fail ; and the reason assigned

is, that the soil, being warm, causes them to shoot too early in the spring. Hence late frosts destroy not only the fruit, but the tree also.

The principal, and original street, lies on the Western side of the plain, along the foot of a ragged hill ; in which an Italian, who resided here some time since, found, as he informed the Rev. Mr. Farrand, marble, as fine, and beautiful, as the handsome specimens of his own country. The houses on the street are few, scattered, and indifferent. In it stands a decayed church, without a steeple, belonging to the South parish.

There is a furnace in Canaan, and several anchor forges. The iron, cast and manufactured in these works, is principally brought from Salisbury and Kent. Samuel Forbes, Esq. the proprietor of the most considerable of them, has, chiefly by this business, become one of the wealthiest men in the State.

There are two parishes in Canaan, called the North, and the South, parishes. The churches in both are ordinary ; and the general appearance of the town not indicative of any peculiar degree of prosperity. The scenery is in several places noble.

In 1756, Canaan contained 1,100 inhabitants ; in 1774, 1,635 : blacks 62 ; in 1800, 2,037 : free blacks 59 ; slaves 4 ; and, in 1810, 2,203.

We left Canaan Thursday morning, September 20th, and rode to Stockbridge, through the North parish of Canaan, and the towns of Sheffield, and Great Barrington : twenty-five miles.

Sheffield lies on the Southern border of Berkshire ; and is the oldest settlement in that County. It occupies the principal part of the valley between the Green Mountains and Taghkannuc, on both sides of the river ; which is every where bordered by a chain of rich and beautiful intervals. The rest of the valley is here, principally, a light, level ground ; in some places fertile, but generally of an indifferent soil. The town is chiefly built on a single street, running about four miles and a half on the Western border of the intervals. On the Southern half the houses are thinly scattered. In the Northern half they are more numerous, and better. Upon the whole, it is rather a pretty settlement.

Among the interesting objects, which are in full view, the river and its beautiful intervals, and the mountains on the East and on the West, hold a place of high distinction. Taghkannuc, clad at this time in misty grandeur, partly embosomed and partly capped by clouds, particularly ornaments the landscape. Its height is about three thousand feet above the ocean. Its sides are not precipitous, nor its summits angular; but it is every where limited by lines, which are flowing and graceful. This fact has always appeared to me sensibly to diminish its magnificence. Still it is a highly sublime object.

In the year 1781, I ascended the loftiest summit of this mountain; and found a most extensive, and splendid prospect spread around me. On the North rose Saddle mountain, at the head of the Hooestennuc valley, at the distance of forty miles. At the same distance the Catskill mountains formed, on the West, the boundary of the vast valley of the Hudson. In the South-West rose Butter Hill, the most Northern summit of the Highlands on the Western side of that river, and the majestic front of an immense range receding gradually from the sight, limited the view, beneath us, towards that quarter of the horizon. The chain of the Green Mountains, on the East, stretched its long succession of summits from North to South a prodigious length; while over them, at the distance of forty miles, rose the single, solitary point of Mount Tom; and farther still, at the termination of fifty and sixty miles, ascended successively various eminences in the Lyme Range. Monadnock, at the distance of seventy miles on the North-East, is distinctly discernable in a day sufficiently clear; but to us, the weather being in a small degree hazy, was invisible. Immediately around us, spread a collection of flourishing settlements, and finely varied the grandeur with their beauty.

On this mountain is the North-West corner of the State of Connecticut. Before the Oblong was yielded to New-York, the North-West corner of Connecticut was Westward of this mountain, about three-fourths of a mile. At this spot is now the South-Western corner of Massachusetts, in latitude  $42^{\circ} 3' 15''$ ; as determined by the Rev. Dr. Ewing, and Dr. Rittenhouse of

Philadelphia, and Thomas Hutchins, Esq. Geographer of the United States, July 21st, 1787; when the dividing line between Massachusetts and New-York was finally settled.

The magnetic variation, as determined by these gentlemen on this spot, the day following, was  $5^{\circ} 3'$  West.

The magnetic variation, as determined by the Rev. Dr. Williams, professor of Natural Philosophy in Harvard College, at the same place, and on the same day, was, at seven o'clock, A. M.  $4^{\circ} 51'$ ; at eleven o'clock, thirty minutes,  $5^{\circ} 55'$ ; at seven o'clock, P. M.  $5^{\circ}$ . At the same place these gentlemen also determined that the magnetic variation for fourteen years and two months, commencing May 18th, 1773, and ending July 22d, 1787, had been annually  $3' 5''$ . The course of the West line of Massachusetts, as determined by Messrs. Ewing, Rittenhouse, and Hutchins, July 24th, was North  $20^{\circ} 24'$  East. These gentlemen were commissioned by Congress to settle this line, at the request of both States.

The North line of the Oblong, as observed by Professor Williams, September 30th, 1784, varies from an exact Western direction  $1^{\circ} 15'$  N.

These facts were communicated to me by the Hon. Timothy Edwards of Stockbridge, one of the Commissioners employed by Massachusetts on the above mentioned occasion.

Sheffield was incorporated in the year 1733; six years before any other town in this County, and twenty-two years before the commencement of the last Canadian war. The first settlers were, therefore, exposed to Indian depredations during a considerable period, without any possibility of obtaining timely assistance. They were emigrants from Westfield; and were allured hither by the fine intervals on the Hooestennuc. The character, which they brought with them, their descendants still keep; and are just about as industrious, as moral, and as propense to improvement as their ancestors.

Sheffield has always been subject to the fever and ague; a calamity, to which the slow motion of the Hooestennuc, through its whole breadth, may not improbably contribute. Several marsh-

es also, within its limits, are supposed to have had a malignant influence on the health of the inhabitants. In the year 1795 they attempted to drain two of them ; but did it imperfectly : as a consequence of which fact, an offensive fetor filled the atmosphere ; the inhabitants were suddenly seized with a malignant bilious fever ; and seventy persons died.

It is said that the pulmonary consumption is very rare in Sheffield.

The number of inhabitants in 1790, was 1,899 ; in 1800, 2,050 ; and, in 1810, 2,439.

Great-Barrington lies immediately North of Sheffield. It is built on a single street, upon the Western bank of the Hooestenuc, throughout the breadth of the township ; and throughout half that distance on another street upon the Eastern side of the river. The surface is pleasanter than that of Sheffield. The character of the inhabitants, who had the same origin, is a strong proof of the permanent influence, which education, of any sort, has on the minds of men. It is probable, that there has been more horse-racing in these two towns, than in all the State of Massachusetts beside. The soil of Great-Barrington is excellent ; yet we saw very few marks of thrift, or prosperity. The houses are in many instances decayed ; the Episcopal Church barely decent ; and the Congregational, ruinous. A small number of houses are exceptions to this account ; particularly on the Eastern street ; where the inhabitants are descendants from the Dutch of New-York, and exhibit proofs of industry and wealth.

Great-Barrington was originally the shire town of the County of Berkshire. Few places can boast of a better soil, or more delightful situation ; yet, I suspect, few have been less prosperous, or less happy. Religion has had here, generally, a doubtful existence ; and, during the little time, in which they have had a minister of the Gospel, he has scarcely been able to find a subsistence.

Since these remarks were made, I have passed through Great-Barrington several times ; and have observed with satisfaction, that the people are beginning to exhibit, more generally, proofs

of industrious exertion. In the year 1806, in the journey heretofore referred to, I learned with particular pleasure, that the Presbyterian Congregation had settled a regular and respectable minister, after a vacancy of thirty-four years. A spirit of improvement was visibly increasing.

A few of the inhabitants of this town are of Dutch extraction; and exhibit at least equal evidence of the lasting influence, which education extends through succeeding generations of mankind. In the year 1790, the inhabitants of this township were 1,373; in 1800, 1,754, inhabiting 264 houses; and, in 1810, 1,784.

The following fact was recited to me, many years since, by a respectable man, as having taken place in this town. I know no reason to question the truth of the recital, except what is furnished by the nature of the fact itself.

A Mr. Van Rensselaer, a young gentleman from Albany, came one evening into an inn, kept by a Mr. Root, just at the Eastern end of the bridge, which crosses the Hooestennuc in this town. The inn-keeper, who knew him, asked him where he had crossed the river. He answered, "on the bridge." Mr. Root replied, that that was impossible; because it had been raised that very day; and that not a plank had been laid on it. Mr. Van Rensselaer said, that this could not be true; because his horse had come over without any difficulty, or reluctance; that the night was indeed so profoundly dark, as to prevent him from seeing any thing distinctly; but that it was incredible, if his horse could see sufficiently well to keep his footing any where, that he should not discern the danger, and impossible for him to pass over a bridge in that condition. Each went to bed dissatisfied: neither believing the story of the other. In the morning Mr. Van Rensselaer went, at the solicitation of his host, to view the bridge; and, finding it a naked frame, gazed for a moment with astonishment, and fainted.

From Barrington, in our way to Stockbridge, we crossed Monument mountain: a spur from the Green Mountain range. The name is derived from a pile of stones, about six or eight feet in diameter, circular at its base, and raised in the form of an obtuse

cone over the grave of one of the aborigines. The manner, in which it has been formed, is the following. Every Indian, who passes by the place, throws a stone upon the tomb of his countryman. By this slow method of accumulation, the heap has risen in a long series of years to its present size.

The same mode of raising monuments for the dead, except in one particular, has existed among other nations. The Israelites raised a similar monument for Achan; for the king of Ai; and for Absalom. Whether this was done from motives of general respect for the dead, and thus in conformity to a general custom, or with a design to express their abhorrence of the persons buried, will admit of a doubt. The manner, in which the phrase, "*The stones of the pit*," is used by the Prophet Isaiah,\* an allusion, I presume, to the same practice, does not remove the uncertainty. By the natives of America it seems to be an expression of peculiar reverence, and an act of obedience to the dictates of their religion.

After passing the ridge of the mountain, the country on the North opens beautifully to the eye of a traveller. The mountain itself presents, on its Eastern front, a magnificent and awful precipice, formed by ragged, perpendicular cliffs of white quartz, and rising, immediately West of the road, between five and six hundred feet. Beyond it, spreads the valley of the Hooestennuc, here running for several miles from East to West, and the fine hills, by which it is bordered. In the valley, and on the hills, the farms and houses ornament the landscape: while a variety of mountains, by which the whole scene is encircled to the eye, finish the view. Among these objects is the hill, immediately North of the town. Its soil is rich, and its vegetation vivid. Its summit is crowned with a grove; and immediately behind it Rattlesnake mountain forms a back ground of the picture.

The Hooestennuc, in its passage through Stockbridge, takes from Lee, a course to the West, of not less, as I should judge, than eight miles; when, turning round a huge promontory, formed by the Western extremity of Monument mountain, it pursues again

\* Isaiah xiv. 19.

its Southern course to Great Barrington. Every where, and particularly in Stockbridge, it is bordered by the richest intervals, of elegant forms, and covered with the most beautiful verdure. Upon the whole, few spots in New-England are more romantically delightful than the township of Stockbridge.

One of these mountains, known here by the name of the East-Mountain, a spur also from the same range, wears, towards its South-Western limit, evident proofs of having undergone a violent convulsion, at some distant period. A huge mass of rocks, tumbled from its summit and sides, lies in confusion at the bottom. This event preceded the existence of the oldest trees in the valley, and of any existing Indian tradition: for they exhibit no marks of the violence, with which this heap of ruins descended. Amid the chaos, ice continues throughout the summer.

Still further South, a rock descended from this mountain within the last twenty years, (1811,) which was somewhat more than thirty feet in length, near twenty in breadth, and in different places from one to perhaps six in thickness. At the bottom of the precipice it lodged upon two others. On the top of one of these a round stone about fifteen inches in diameter, probably forced along with it in its fall, was caught between this and the descending rock, where it now stands, and is the immediate support of the latter. The mind, when surveying it, can with difficulty conceive how it was possible for the stone to have been arrested in the course of a rapid descent, on the top of a rock every where convex, and fixed by accident where it could hardly have been fixed by the hand. The large rock from its present position is called the Table. Under it eight or ten persons may sit without inconvenience.

Stockbridge was incorporated in 1739, six years after Sheffield, and twenty years before any other town in this County. For a considerable time it was almost merely an Indian settlement, named Hooeastennuc, containing, perhaps, three or four English families. Among these people a mission was begun in October, 1734, by the Rev. John Sargeant; a clergyman of great respectability. This gentleman was born at Newark, New-Jersey, in

1710, and was educated at Yale College ; where he took the degree of A. B. in 1729. In 1731 he was appointed a Tutor in that Seminary ; and continued in that office four years ; in which time he was licensed to preach the Gospel. A few weeks after he quitted the Tutorship, he entered upon his Mission ; and on the 31st of August, the following year, was ordained at Deerfield as an Evangelist. He continued in the business of a Missionary until his death ; which happened July 22d, 1749, in the thirty-ninth year of his age. Mr. Sargeant baptized one hundred and twenty-nine Indians, during his Ministry ; of whom forty-two were Communicants, when he died. He translated the whole New Testament, except the Revelation of St. John, and several parts of the Old Testament, into the language of the Mohekaneews.

During his Ministry considerable efforts were made to civilize, and christianize, the Indians of Stockbridge. A house was erected for the purpose of boarding, schooling, and instructing in religion, husbandry, and mechanical business, a number of Indian children. Mr. Thomas Hollis, of London, had ordered twenty-four of these children to be educated at his own expense. To his efforts those of many other benevolent persons were united ; and strong hopes were entertained, that they would issue in the best consequences to this unhappy people. But the death of Mr. Sargeant and some other unfortunate incidents, which took place about the same time, particularly the war, which soon after broke out between France and England, frustrated these benevolent intentions.

The Rev. Mr. Edwards, afterwards president of Nassau Hall in New-Jersey, having been dismissed from the Ministry in Northampton, succeeded Mr. Sargeant in 1751 ; and continued in the Mission until 1757. As he was unacquainted with the language of his parishioners, he preached to them by an interpreter. Their reverence for him was very great : and his family are still regarded by their descendants with peculiar respect. After a considerable interval Mr. Edwards was succeeded by the Rev. John Sargeant, youngest son of the gentleman mentioned above ; who has nobly devoted his life to the service of these poor people. Since

he began his Ministry, the Oneidas have invited the Hooestennuc Indians to plant themselves, in their neighbourhood, in the state of New-York ; and have given them the township of New-Stockbridge. To that place Mr. Sargeant has removed with his flock ; and has already done no small good in civilizing and christianizing them. It has been supposed, that in every state of society the Indian tribes have, for a long period, been diminishing in their numbers. At the last interview, which I had with Mr. Sargeant, he informed me, that his own people were increasing ; not by accumulations from other tribes, but in the ordinary course of population.

This tribe has been known, throughout New-England, by the name of Stockbridge Indians. In their own language they were called in the singular, Muhhekanneuw, (Doctor Edwards writes it Mohekaneew,) and Muhheakunnuk in the plural. This name, as interpreted by themselves, signifies "*the people of the great waters, continually in motion.*"

Their history, as derived from the traditions of their ancestors by one of the tribe, is summarily the following.

They came from a distant country, West by North ; i. e. a country lying in that direction from their present residence ; crossed over the great waters, which separate that country from this ; and after a series of pilgrimages, arrived on the border of Hudson's river. Here they settled and spread through the neighbouring country. Their ancestors, they say, were much more civilized than their descendants ; lived in towns and villages ; and were very numerous ; but, being dispersed by a famine, were obliged to seek for subsistence in distant regions. In the progress, they lost their arts and manners ; or, in the language of the historian, "apostatized." Before they began sensibly to diminish, they could furnish on any emergency a thousand warriors ; and of course consisted of about four or five thousand persons ; probably, however, not more than four thousand.

It ought to be added from this writer, that when their ancestors came to Hudson's river, they there first, after passing over the great waters, "where," to use the language of the historian,

“ this and the other country is nearly connected, saw ebbing and flowing waters ; and said one to another, this is like Muhheakun-nuk ; the place of our nativity.” In the description given above of their rout, this account is precisely established. Between the straits of Behring, by which America and Asia are “nearly connected ;” and Albany, the course is as near West by North, as we can suppose such a tribe, wandering over such a distance, would place it : and the waters of the Hudson would be the first “ ebbing and flowing waters,” which emigrants would discover, after they had left those straits. In one instance, therefore, we have found an Indian tradition, directly asserting in terms, which cannot easily be misconstrued, that the Americans, partly at least came from the Eastern shore of Asia.

The Stockbridge Indians have been uniform friends to the English Colonists. They have acted for them as interpreters and spies ; and have often fought in their armies. Yet I have never heard of an instance in which they were treacherous. Several of them have been respectable for their understanding ; and more for their piety. Yet it must be owned, that the body of them have, in many respects, sustained a very imperfect character. Upon the whole, they have behaved well in so many instances, as to prompt in my mind an ardent wish, that their present and future descendants may increase in numbers, virtue, and happiness.

This tribe was, both by itself and by the other tribes, acknowledged to be the eldest branch of their nation ; and as such, regularly had the precedence in their Councils.

When President Edwards first moved to this town, it contained but five English families ; and only seven, till after the close of the last Canadian war. From this period, its population, and that of the County at large, increased very rapidly. The inhabitants have experienced many troubles from political division ; but have not, so far as I know, permitted their contentions to affect their ecclesiastical concerns. In industry, intelligence, morals, and religion, they are not often excelled.

Stockbridge contains one Congregation only. In 1790, the number of inhabitants was 1,336; in 1800, 1,246; and, in 1810, 1,372.

We continued at Stockbridge till Friday, the 21st. Early the next morning we were joined by Mr. L. who had been my companion in the preceding journey. After breakfast we rode through Lenox, six miles; Pittsfield, six; Lanesborough, six; and New-Ashford, seven; to Williamstown, eight: thirty-three. The road through the first eight miles, and the last fifteen was hilly and disagreeable. The remainder was excellent.

Lenox, the shire town of this County, is principally built on a single street, upon a ridge, declining rather pleasantly to the East and to the West, but disagreeably interrupted by several deep vallies, crossing it at right angles. The soil; and the buildings, are good: and the town exhibits many proofs of prosperity. The public buildings consist of a church, a court-house, a school-house, and a gaol.

Lenox includes a single Congregation, and a few Sectaries; and contained, in 1790, 1,169 inhabitants; in 1800, 1,041; and, in 1810, 1,310.

Pittsfield is a beautiful township, lying in a noble expansion between the Taghkannuc and Green Mountain ranges. It is about twelve miles in breadth; and is sublimely bounded on the North by the lofty summits of Saddle Mountain. On the South, West Stockbridge, or as it ought to be called, Richmond Mountain intrudes into it centrally, as a magnificent promontory into the ocean. Into Stockbridge this expansion extends on the Eastern side through the townships of Lenox and Lee; and, on the Western, through the beautiful valley of Richmond. The two head branches of the Hooestennuc unite in Pittsfield; and are both prettily bordered by rich intervals.

The soil of this township is excellent. A small, but handsome village is built in the centre around the church. Elsewhere, it is distributed into farms.

Pittsfield was incorporated in the year 1761; about six years before Lenox. Its Indian name was Pantoosuc. Its English

name was given it in honour of the Earl of Chatham. The settlement was begun before the last Canadian war: and four families continued in it through that war, in fortified houses. After the peace of 1760, the beauty of the situation, and the richness of the soil, allured settlers here in great numbers.

Pittsfield includes two Congregations. The number of its inhabitants, in 1790, was 1,992; in 1800, 2,261; and, in 1810, 2,665.

There is a printing-office in Pittsfield and another in Stockbridge. The road from Pittsfield to Lanesborough, which is very pleasant, lies along the Western branch of the Hooestennuc, and by the side of a lake, about a mile in length, commonly, but erroneously, supposed to be the head water of this river.

The township of Lanesborough lies principally on two hills, and an interjacent valley, commencing near the Southern boundary of New Ashford, and extending five or six miles to the South; gradually increasing its breadth, until it is lost in the greater valley of Pittsfield. The hill on the East is a spur of Saddle Mountain. That on the West is a part of the margin of the Taghkanuc range. Both the hills and the valley are beautiful. The valley is a vast meadow, of the richest luxuriance, and the most animated verdure; and is gaily ornamented by the fine lake, mentioned above; and bounded to the eye, at the distance of eight or ten miles below the centre of the town, by the Northern front of West Stockbridge mountain.

The soil of this township, as well as of Pittsfield, Stockbridge, &c. is the loam formerly mentioned in the description of Northford; and is fitted alike for all the produce of the climate. Here it is of the best quality.

The houses in Lanesborough are good farmers' habitations.

Lanesborough was incorporated in 1765; and contains a Presbyterian, and a small Episcopal Congregation. The number of inhabitants, in 1790, was 2,142; in 1800, 1,443, occupying 213 houses; and, in 1810, 1,303.

In this township is wrought a great quantity of white marble; a subject, of which I shall say more hereafter.

New Ashford is a rough, disagreeable township, lying on the hills, which connect Saddle mountain with the Taghkannuc range. These hills are of uncouth forms, and sudden acclivities. The vallies between them wear an aspect equally forbidding; and might, with perhaps more propriety, be denominated ravines. The soil, also, is lean; the houses are generally poor; and the inhabitants are plainly in indifferent circumstances. The settlement is recent, and scattered. The only pleasant objects in our ride through it, were the numerous rivulets, which murmured down the vallies with a clean and sprightly current; and Saddle Mountain, the South-Western base of which is in this township. Among the rivulets, we passed the Western branch of the Hooestennuc, about seven miles Northward of the lake, mentioned above. It is here a small brook; crossing the road from the hills on the West, and descending in a narrow valley by the road-side into Lanesborough. Before its entrance into the lake, it is swollen into a stream of a considerable size.

I am, Sir, yours, &c.

## LETTER II.

Saddle Mountain—Williamstown—Col. Williams—Williams College.

*Dear Sir,*

SADDLE MOUNTAIN, which derives its name from its resemblance to a saddle, is the highest land in this State. Its whole length, from North-East to South-West, may be about six miles. Its South-Eastern front is extensively visible throughout Berkshire; and, from high elevations, in the States of New-Hampshire, New-York, Vermont, and Connecticut, at very great distances. Its figure is remarkably fine; and its aspect majestic in the highest degree. On its Northern side ascends the mountain of Williamstown; another part of the same spur, of great elevation.

The South-Western summit has, by repeated mensurations, differing very little in their results, been found to be about 3,700 feet above the subjacent valley, and therefore at least 4,000, above the level of the ocean. During a great part of the year, it is either embosomed, or capped, by clouds; and indicates to the surrounding inhabitants the changes of weather, with not a little exactness.

This mountain is a spur from the range of Taghkannuc, connected with it by the hills of New-Ashford. From the Green Mountain range it is entirely separated by the valley, and river of Hoosac.

The township of Williamstown lies principally in a triangular valley, bounded by Williamstown Mountain on the South, the range of the Green Mountains on the East, and that of Taghkannuc on the West. These ranges approach near each other on the North, leaving a narrow opening into Pownal. Between the former of these mountains, and the North-Eastern ends of Williamstown and Saddle mountains, there is another opening on the South-East; through which Hoosac river enters Williamstown from Adams; as it does Pownal from Williamstown, through the first of these openings. There is, also, a third passage out of this

valley ; viz. that, in which our road lay, between the South-Western ends of these mountains, and the range of Taghkannuc.

This triangular area may, at a loose estimate, be six or seven miles on a side. Its surface is irregular in the extreme ; being every where made up of varieties. The borders of the Hoosac, and of Green River, which joins it from the South, are formed by beautiful successions of intervals. The scenery, as a whole, is pleasant but more distinguished for sublimity than beauty.

Williamstown is almost wholly settled by farmers, living on their respective plantations. The town is built near its centre. The principal street runs along a declivity, sloping from the Taghkannuc range toward the East. In its progress it passes over three small rising grounds ; on the Westernmost of which stands a handsome church ; and on the others, the two colleges, belonging to the Institution, denominated Williams College.

There are many good houses in Williamstown ; and several handsome ones.

Williams College owes its existence to Colonel Ephraim Williams ; a native of New Town in Massachusetts. This gentleman spent a considerable part of his life in the County of Hampshire, then including all that part of the Province of Massachusetts Bay, which lies West of the County of Worcester. During the war, which commenced in 1740, he commanded the line of forts, built on the Western side of Connecticut river ; and resided principally at Hoosac, or Massachusetts Fort ; which stood not far from the North-Eastern end of Saddle Mountain, within the present township of Adams, and on the Eastern border of Hoosac river. At this time a small number of persons began a settlement within the limits of what is now Williamstown. The hardships, suffered by these men, were of course great ; and appear to have excited in the mind of Colonel Williams an intention of extending his beneficence to them at some future period. To encourage them in the dangers, and difficulties, which he saw them undergo, he at times intimated to them his intention.

In 1755, he commanded a regiment, destined to a post at the head of lake George. As he was proceeding through Albany, he

made his will in that city, on the 22nd of July. In this instrument, after giving certain legacies to his connections, he directed, that the remainder of his land should be sold at the discretion of his Executors, within five years after an established peace; and that the interest of the monies arising from the sale, and also the interest of his notes and bonds, should be applied to the support of a free-school in a township, West of fort Massachusetts; provided the said township fell within Massachusetts Bay, upon running the line between that Province and New-York; and provided, the said township when incorporated, should be named Williamstown.

The property, designated in this bequest, was loaned on interest; and, after an accumulation of thirty years, was considered as a fund, sufficient to warrant the institution of the free-school, contemplated in the will. The spot, pointed out, was, June 20th, 1785, incorporated by the name of Williamstown. In 1785, nine gentlemen were appointed trustees for the management of the donation, and the free-school to which it was to give birth. In 1788, they voted to erect a building. The Legislature granted them a lottery, which yielded 4,000 dollars; and the inhabitants contributed 2,000 more. In 1790, they built a brick edifice, eighty-two feet in length, and forty-two in breadth, of four stories, on the middle eminence in the principal street. It contained twenty-eight rooms, and a chapel. The expense of erecting it was 11,700 dollars; and the remainder of the fund was about the same sum.

The school was opened in October, 1791, under the superintendency of Mr. Ebenezer Fitch, now Rev. Dr. Fitch, President of Williams College. It consisted of two establishments; an Academy, and an English free-school; and, under the direction of this gentleman, immediately became prosperous. A considerable number of students resorted to it from Massachusetts, and the neighbouring States, and even from Canada. In 1793, the Legislature, being informed of its flourishing condition, erected it into a College, by the name of Williams College. The Trustees of the free-school were, by the act of incorporation, constituted,

together with four other gentlemen, including the President, Trustees of the College. The Trustees may be seventeen in number; may fill all vacancies in their Board; and may hold property, the annual income of which shall be 20,000 dollars. In October of the same year, the College commenced its operations by the admission of three classes of students. In 1794, a lot was purchased, and a house built, for the President. The same year the Legislature granted to the College 4,000 dollars; and in 1796, two townships of land in the District of Maine. One of these townships was sold the following year for 10,000 dollars. With this sum, and an addition of 2,400 dollars, the Trustees erected another brick building one hundred and four feet in length, twenty-eight in breadth, of four stories, and containing thirty-two chambers. The Seminary possesses a well chosen library, of about 1,000 volumes; and a small, but valuable, philosophical apparatus. Towards the increase of these each student pays a trifling tax. Two private libraries, belonging to the students, contain, perhaps, 500 volumes. The Faculty consists of a President and a Vice President, a Professor of Mathematics and Natural Philosophy, and three, or four Tutors. The number of students may be averaged at one hundred. The government and instruction, the learning and morals, of the students are all honourable to the Institution. The expectations of its founder are therefore more than fulfilled.\*

I am, Sir, yours, &c.

\*For most of these facts I am indebted to a history of Williams College, written by the Rev. Dr. Fitch, and published in Hist. Col.—V. viii.

### LETTER III.

Donations for the promotion of learning—Insect—Rev. Mr. Swift.

*Dear Sir,*

A MAN of reflection is naturally led, when reviewing the principal subject of the preceding letter, to feel strongly the advantages, derived by mankind from the destination, made of his property by Col. Williams. The original sum, given for the foundation of a free-school, was probably not more than four or five thousand dollars. By the accumulation of interest, and various other additions, flowing from both public and private sources, such as donations of this kind are apt to receive in their progress, it has become the means of supplying education, science, and usefulness, to a multitude of mankind. Recent as is its origin, it has already sent into the world a considerable number of respectable Clergymen, Lawyers, and Physicians; together with many other men, scarcely less useful in their several departments. From the same fountain new waters are annually issuing; and will in all probability continue to issue through a series of ages. These will spread the same happy efficacy still farther and farther. Upon the whole, a mass of benefits will be here originated, communicated, and enjoyed, many millions of times transcending that, which usually results from much larger sums, disposed of in any customary manner. At the same time, the Founder has transmitted his name to distant ages, and will be remembered with gratitude and honour, long after the period, at which, otherwise, he would have been forgotten; and very long after the names of multitudes, richer, but less wise and munificent, than himself, will have perished.

With this subject in view, I have often wondered, that, among the numerous wealthy men in the United States, there should always have been found such a paucity of benefactors to literary Institutions. The benefactors of the principal Colleges in New-England have been already mentioned. Among these the Uni-

versity in Cambridge can boast of a greater number of individuals, and a larger amount of donations, than all the rest. But even these have been few, compared with what might have been justly expected from the wealth of its neighbourhood.\* All that can be either necessary, or useful, for the enlightened education of youth; a complete array of professorships, liberally endowed; an ample provision of all kinds of scientific apparatus; a cabinet, replenished with a generous assortment of mineralogical specimens; a botanical garden, stored with the vegetable productions of America at least; and a library, containing fifty thousand volumes; might have been easily furnished to that Institution by private munificence; and no man's personal enjoyments, nor those of his family, been perceptibly lessened.

When we look at the history of Great Britain, a very different scene presents itself to the eye. Thirty of the colleges belonging to the Universities of Oxford and Cambridge, were, if I mistake not, founded by private persons; and most of them by individuals. When to these are added fellowships, professorships, libraries, and other splendid and extensive means of promoting learning and science, we are presented, not with a resemblance, but a contrast to every thing of the same nature in our own country.

I shall be answered, that England is a country far richer, than our own; and that in England, therefore, liberal contributions to these objects may be reasonably looked for: while in our own infantine circumstances they ought not to be expected. That England is now as rich as any other country on the globe, I am ready to admit: but I have many doubts whether, between the commencement of the thirteenth and the termination of the fifteenth

\* Very liberal donations since the text was written have been given to the University in Cambridge both by the State of Massachusetts and by individual gentlemen. The State has given to this Seminary \$100,000 from the public funds, beside considerable benefactions by lotteries. Count Rumford, a native of Massachusetts has left to this University \$50,000 as a legacy. A gentleman of Boston, Samuel Elliott, Esq. has made a donation of \$20,000 as a foundation for a Professorship of the Greek language. Another gentleman whose name is unknown to me has given \$25,000.

The Legislature has given \$60,000 also to Williams and Bowdoin Colleges.

century, the wealth even of that country was materially greater, in proportion to the number of its inhabitants, than that of the Southern division of New-England is now. Between these periods, however, more than half of the English colleges were founded. Whether this opinion be just, or not, the wealth of New-England is amply sufficient to furnish the best means of education; and foundations numerous and ample enough, to enable a considerable number of persons, distinguished for their talents, to pursue, through life, literature and science in their remoter fields, and up their sublimer heights, amid ease and leisure. Such foundations have been, peculiarly, the sources of the extensive learning and science, which are so honourable to the English nation; and of the mental distinction, acquired by those, who have been eminently its pride, ornament, and blessing.

Unless I am misinformed, there is not a single Fellowship, established in the United States. There certainly is none in New-England; where far greater efforts have been made to promote education, than in all the rest of the American Union. Nor is there a single foundation, on which an individual may pursue literary objects to any considerable extent, except the Professorships of colleges: few of them very liberally supported; and most of them demanding much active business from the incumbent. Of these I know of but one, wholly supported by an individual American.\*

There have, indeed, been several very honourable contributions to the advancement of education, made in this country. The late benefactions to the Theological Seminary in Andover are noble. A Mr. Bacon of Colchester in Connecticut gave his whole estate by will, amounting to between thirty and forty thousand dollars, for the establishment of an Academy; and a Mr. Staples of Weston his, amounting to perhaps twelve thousand, for a similar purpose. In Boston, Salem, and other places in the vicinity, a liberal contribution has been raised for the establishment of a botanical Professorship, and garden. To the donors, in every instance, I give cheerfully the full tribute of respect;

\* Some others have been established at Cambridge since the date of this journey.

and to such of them as are living, I wish the best of blessings. But to these efforts what extensive and profitable additions might be easily made. A moderate share of expansion in the understanding, and the heart, might replenish our Colleges with fellowships, and professorships; place in their respective libraries all the books, necessary for the useful consultation of learned men; and store their philosophical rooms with all the implements, fitted for the display, or the advancement, of scientific discoveries. In these observations I intend to include means of leisure and ease for the pursuit of learning, wherever it can be found; and of science wherever it can be developed. Men whose abilities, and dispositions, qualify them for such pursuits, are the boast of the countries, in which they live. But, if they are to be thus employed, they cannot at the same time be occupied in the acquisition of that property, by which they are to be supported.

I well know, that to the ear of selfishness this strain will sound harshly; and am well aware, that I shall be answered with that grave tale of avarice concerning the necessity, and the difficulties, of providing for a family; and concerning the great number of private and public claims, continually made on wealth; and shall probably be confronted by that white-haired adage, that "charity begins at home." To this story I reply with very little complacency, that the charity in question not only begins, but ends, at home. To provide for our children whatever will contribute to their usefulness, or comfort, so far as it can be done by reasonable efforts, is unquestionably our duty; but no precept requires, and no defensible consideration demands, that we should spend life to nurse their pride, and pamper their luxury. In the United States where the government of opulent parents is but too commonly loose in principle, and imprudent in practice; where the children of such parents are usually habituated neither to industry nor economy, and are nurtured from infancy in habits of indulgence, expense, and show; where estates cannot be entailed; and where property is almost always acquired by those who possess it, and scarcely ever retained, beyond two generations,

by those to whom it descends ; there is no folly more palpable, than that, which is seen in the toil, anxiety, and suffering, undergone by a worshipper of gold, struggling to accumulate wealth for his children till he begins to step into the grave. The children are ruined for time and eternity by the labours of the parent : for they are taught, that all good lies in wealth, splendour, and luxury ; and not in intelligence, and virtue. Accordingly, they seek for no other. In the pursuit, they buzz through a giddy, momentary course ; at the end of which they see their Elysium vanish for ever ; and either expire under the loss, or pine through their remaining days in uselessness, degradation, and despair. It would be easy to name a man of great reputation and worth, who left to his children a million of dollars ; and whose sons fluttered through their fortunes in four or five years ; when one of them became the tenant of a jail, and died of a broken heart. How much happier would they have been, had their father been a bankrupt, or left his estate to the public.

But there are many persons, who cannot make even this plea, and who are obliged, at the approach of death, to hunt for heirs and objects, on which they may bestow their property. If these men will inquire, they will soon learn, that the objects, here urged, are at least among the best ; that, devoted to them, their property will do more good to mankind, and prove the source of more honour to themselves, than can result from almost any other method of disposal. Without learning, what would their country be ? A wilderness. What their state of society ? That of Savages.

I am not weak enough to imagine, that these observations will operate against the avarice, and pride, which they are intended to affect ; but I find my own reward, for the trouble of writing, in the pleasure of uttering a little truth concerning this subject. At the same time, I beg leave to remind those, who are implicated in them, that learning cannot flourish without support ; that institutions, furnishing all the advantages of education, cannot exist without extensive pecuniary foundations ; and that until these are supplied by those, who alone can supply them, it will no longer

become such men to inquire, either with contempt, or curiosity, why learning does not flourish more in this country. On this subject let such men be dumb. Col. Williams has manifested a nobler spirit : and his memory will live, indefinitely, not only in Williamstown, but throughout the American Union, in the grateful recollection of all wise and good men.

In September, 1806, I passed through this town on a journey to Vermont. While I was here, President Fitch shewed me an insect, about an inch in length, of a brown colour, tinged with orange, with two antennæ, or feelers, not unlike a rosebug in form, but in every respect handsomer. This insect came out of a tea-table, made of the boards of an apple-tree, and belonging to Mr. Putnam, one of the inhabitants, and a son of the Hon. Major-General Putnam, late of Brooklyn in Connecticut.

I went with President Fitch to Mr. Putnam's, to examine the spot, whence the insect had emerged into light. We measured the cavity ; and found it about two inches in length, nearly horizontal, and inclining upward very little, except at the mouth. Between the hole, and the outside of the leaf of the table, there were forty grains of the wood. President Fitch supposed, with what I thought a moderate estimate, that the saw-mill, and the cabinet-maker, had cut off at least as many as thirteen more : making sixty in the whole. The tree had, therefore, been growing sixty years, from the time, when the egg was deposited in it, out of which the insect was produced. How long a period had intervened between the day, in which the apple-tree was cut down, and that, in which the table was purchased by Mr. Putnam, is unknown. It had been in his possession twenty years. Of course, eighty years had elapsed between the laying of the egg, and the birth of the insect.

After its birth, it was placed under a tumbler, and attempts were made, by offering it for sustenance wood of the apple-tree, and bread, to prolong its life. It ate a small quantity of the bread ; but, either for want of more proper food, or from being lodged in too cold a temperature, or from some other cause, it died within a few days. My own acquaintance with entomology

is so limited, that I know not whether the observations which I am about to make, may not seem idle, and be really superfluous, to persons acquainted with this branch of natural history. But, I confess, the fact opened to me a train of thoughts, in some measure interesting. I had often wondered at many things, relative to this class of beings; and had often heard men of respectable understanding express their wonder, and their doubts, concerning the same things: particularly, the origin of many *new* tribes of insects, which, within the last forty years, had visited these States: (tribes unknown even to the oldest men living, and, therefore, styled new;) the periods intervening between the appearance and disappearance of other tribes, which are well known; for example, the locust; the apparently absolute disappearance of still other tribes, together with several other things of a similar nature.

I had long been satisfied of the vivacious nature of seeds. Here I was presented with full proof of the same nature in the eggs of insects. The egg, from which this insect sprang, was unquestionably deposited eighty years before its appearance in a living form. Sixty of these years it existed in the tree, where it was laid. Perhaps it may be more unobjectionably said, that eighty years elapsed from the time, when the cause of its future animation was lodged in the tree, to the commencement of that animation. What was true of this insect, is in all probability true of many other species. It ceases, then, to be strange, that various tribes appear once only during the life of man; or during the existence of several generations. Every such tribe must ordinarily be new to the existing generation, because no account of its appearance has been recorded. The want of a regular cause of their existence cannot any longer be alleged, even with plausibility; nor the doctrine of equivocal generation be maintained, even on the unsolid ground of inexplicableness. The appearance, in 1770, of the palmer worm, after an interval of thirty years, ceases to be an object of wonder; nor can we be surprised, that it has not appeared again, although a longer period has elapsed. There can be nothing perplexing in the periods of the locust; nor any

further necessity of inquiring, whence new species of insects are derived, or what has become of those which are apparently extinct.

It is here proved, that in the proper situation, always known, and selected by the insect for its eggs, and by the eruca for its chrysalis, the cause of animation may continue perfect through an indefinite period : while yet its operations are suspended. There may be eggs, as well as seeds, which may contain, uninjured, the principle of future life for several hundreds, or thousands, of years. Yet, afterwards, the one by a change of circumstances may produce a living animal, as the other, a living plant.

It will be admitted, that every such being was created for ends, which it was fitted to accomplish. It must also be admitted, that, if all insects were to generate yearly, they would convert the earth into a desert. The Author of the world, therefore, while he has fitted them to fulfil the ends of their being, has subjected them to this slow and interrupted propagation, that they might not desolate the globe. The palmer-worm, were it to appear annually, would, within a few years, empty New-England of its inhabitants ; partly by destroying the means of their subsistence ; and partly by spreading diseases, which would spring from the putrefaction of its innumerable millions. Who can fail to admire the wisdom and goodness, displayed in this conduct of Providence ?

The inhabitants of Williamstown have been injured heretofore by political contentions. Their minister, the Rev. Mr. Swift, a gentleman highly respectable for his good sense and piety, who died February, 1807, laboured long, and faithfully, here, under many discouragements, both from the want of a sufficient support for his family, and from a disheartening insensibility of his hearers to the requisitions of the Gospel. But towards the close of his life he had the peculiar satisfaction to see an extensive revival of Religion in his congregation, and a very interesting change wrought in their character.

Williamstown includes two congregations ; and contained, in 1790, 1,769 inhabitants ; in 1800, 270 houses, and 2,086 inhabitants ; and, in 1810, 1,843.

I am, Sir, yours, &c.

## LETTER IV.

Pownal—Bennington—Grass-hoppers—Shaftsbury—Violent rain—Arlington—Sunderland—Colonel Ethan Allen—Manchester—Dorset—Harwich—Wallingford—Clarendon.

*Dear Sir,*

ON Monday we resumed our journey; and, passing through Pownal, reached Bennington in the evening: fourteen miles.

Pownal is the first township of Vermont in this quarter; the dividing line between this State and Massachusetts crossing the road about two miles North of Williams College. It lies partly on a spur from the Green Mountains, partly in the valley of the Hoosac, and partly on the range of the Taghkannuc. The road from Williamstown passes along the Hoosac, about four miles: then, ascending this spur, and crossing it very obliquely, it descends again into the valley of Bennington. Through the greatest part of the distance we found it rough and disagreeable.

The Western part of Pownal I shall have occasion to describe hereafter. The Eastern part of it lies on a rough, tedious hill; the surface unpleasant; the soil moist, but cold and unproductive: the houses also were ordinary; and the inhabitants apparently unthrifty. I saw here a beautiful object. On the Green Mountains, which rose at some distance Eastward, rested a long train of clouds, variously figured, and spread throughout a great length, from the middle of the acclivity to the summit. A number of others were at the same time slowly sailing up the bosom of the mountain, and one, formed into an elegant arch, crowned the loftiest point. All these the setting sun tinged throughout with a purple, of the most exquisite hue. If the Tyrian dye was a fourth part as beautiful, I cannot wonder, that it was coveted by Emperors. The pleasure, resulting from the novelty and splendour of this scene, was not a little enhanced by the fact, that we met with no other agreeable object in this part of our journey.

Pownal contained, in 1790, 1,746 inhabitants ; in 1800, 1,692 ; and, in 1810, 1,654. This is one instance out of a considerable number, in which even these comparatively new settlements have begun to send out their inhabitants, to populate the Western wilderness.

Bennington lies immediately North of Pownal ; and is the oldest settlement in the State of Vermont on the Western side of the mountains. It is distant from New-Haven one hundred and twenty-five miles ; and from Boston about one hundred and fifty. It is situated principally between the range of the Green Mountains, and the spur, already mentioned, which terminates in a bold bluff, of considerable height, called Mount Anthony. The valley, narrowing to a point within the limits of Pownal, if I mistake not, forms here a considerable expansion ; and opens between the head of Mount Anthony, and the township of Shaftsbury, to that of Hoosac in the State of New-York. The expansion is beautiful ; being formed of little hills and intervening vallies, of slopes and swells, covered with well-cultivated farms. It is bounded on the East by the range of the Green Mountains, and terminated on the North-West by the mountain of Shaftsbury.

The soil of Bennington is of the first quality ; and equally suited to all the productions of the climate. Wheat and grass, the extremes of agricultural vegetation, grow here luxuriantly, and alike. The pastures, even at this period of the year, were covered with rich and abundant herbage ; and appeared in many places like meadows, rather than like fields, in which cattle had fed through the whole preceding season. The soil is that fine, gravelly loam, which, when neither too moist nor too dry, yields every thing gratifying to the wishes of the farmer.

There is a scattered village in the centre of this township. Both the houses, and their appendages, exhibit abundant proofs of prosperity.

Bennington was granted in the year 1749 by Benning Wentworth, Governour of New-Hampshire ; and from him received its name. In 1764, Captain Robinson, a respectable inhabitant of Hardwick in the Province of Massachusetts Bay, having pur-

chased a tract of land, began the settlement of Vermont, on the Western side of the Green Mountains, in this place. He was soon followed by a number of planters; and the township was filled up with great rapidity.

Bennington is the shire-town of the County of Bennington. Its public buildings are a decayed Congregational church, a Court-House and a goal.

Very little snow falls in Bennington; so little, that the inhabitants are rarely furnished with good sleighing; and less, I believe, than the quantity, which usually falls on the borders of Long-Island sound. On this subject I shall make some observations hereafter.

Bennington, and its neighbourhood, have for some time past been infested by grasshoppers of a kind, with which I had before been wholly unacquainted. At least, their history, as given by respectable persons, is in a great measure novel. They appear at different periods, in different years; but the time of their continuance seems to be the same. This year, (1798,) they came four weeks earlier than in 1797, and disappeared four weeks sooner. As I had no opportunity of examining them, I cannot describe their form, or their size. Their favourite food is clover, and maize. Of the latter they devour the part, which is called the silk; the immediate means of fecundating the ear; and thus prevent the kernel from coming to perfection. But their voracity extends to almost every vegetable; even to the tobacco plant and the burdock. Nor are they confined to vegetables alone. The garments of labourers, hung up in the field while they are at work, these insects destroy in a few hours; and with the same voracity they devour the loose particles, which the saw leaves upon the surface of pine boards, and which, when separated, are termed saw-dust. The appearance of a board fence, from which the particles had been eaten in this manner, and which I saw, was novel and singular; and seemed the result, not of the operations of the plane, but of attrition; the cause of which I was unable to conjecture.

At times, particularly a little before their disappearance, they collect in clouds ; rise high in the atmosphere ; and take extensive flights, of which neither the cause, nor the direction has hitherto been discovered. I was authentically informed in Shaftsbury, that some persons, employed in raising the steeple of the church in Williamstown, were, while standing near the vane, covered by them ; and saw at the same time vast swarms of them flying far above their heads. The customary flight of grasshoppers rarely exceeds four or five yards ; and their wings are apparently so weak, as to forbid excursions, extended much beyond these limits. It is to be observed however, that they customarily return ; and perish on the very grounds, which they have ravaged.

Bennington contained, in 1790, 2,377 inhabitants ; in 1800, 2,243 ; and in 1810, 2,524.

It has been generally but erroneously, supposed, that the battle between the British under Colonel Baume, and the Americans under General Stark, was fought within the limits of this township.

I spent the evening, and night, at the friendly, hospitable house of the Rev..Doctor Swift whom I shall have occasion to mention hereafter.

In the morning, Tuesday September 25th we rode to Shaftsbury ; where we dined at an inn with a large company, assembled by a lawsuit between two brothers. I mention this fact, because, so far as I can recollect, it was the first controversy of the same nature, which I had known between two persons thus related. After dinner we set out for Manchester ; and, having rode two miles, were obliged to shelter ourselves from a violent rain in a saddler's shop. Here we continued till sun set ; and then returned to the inn, at which we had dined.

Amends, in my own view sufficient, were made us for this detention. The building, in which we were sheltered, stood on a handsome elevation, overlooking an extensive valley toward the East ; and gave us a full prospect of the Green Mountain range for a great distance. The wind blew violently from the North-

West. The heavens were dark ; the clouds were wild, tossed in fantastical forms, and hurried through the expansion with a violent celerity. Many of them struck the mountains at their middle height ; and thence sailed up their bosom with a motion, which, notwithstanding their rapid progress over our heads, was to our eyes, slow, majestic, and awful. The world was universally wrapt in gloom : and the bosom of the mountain was covered with a deep brown, approaching to black. After this melancholy and cavern-like darkness had continued about one hour ; and tempest, and tumult, appeared to reign universally ; suddenly most beautiful and brilliant spots of gold, of various figures and sizes, formed by the light of the sun piercing through the interstices of the clouds, were seen wandering over the surface of the valley beneath ; crossing the farms, houses, and forests ; slowly ascending the acclivities of the mountains ; gradually sliding over the summits ; and thus fading, successively, from the sight. The contrast between the gloom and the splendour was so strong ; the splendour itself was in many instances so vivid ; (for the spots were not equally bright, and on that account were, in a groupe, more beautiful ;) that they appeared as if the vallies, farms, forests, and mountains, were successively polished and luminous ; while their rapid motion over the vallies and their slow ascent up the mountains in the midst of the moving gloom, by which they were surrounded, interested the eye, especially while connecting them with the wild and violent aspect of all above, and all beneath, in a manner not only singular, but excessive. I never beheld any prospect more striking, or more complete.

Shaftsbury lies immediately North of Bennington ; and has the same excellent soil. A mountain in the North-Western quarter occupies a considerable part of this township. The Southern division is remarkably pleasant : being a collection of rich farms, sloping towards the South, and opening into a handsome prospect. The houses, which we saw, were indifferent ; and indicated less prosperity than would naturally be expected from a soil so productive.

In 1790, Shaftsbury contained 1,999 inhabitants in 1800, 1,895; and in 1810, 1,973.

In the morning we rode through a part of Arlington, and a part of Sunderland, to Manchester; seventeen miles. Here we dined; and in the afternoon rode through a part of Dorset, and a corner of Harwich, to Danby; where we lodged.

The soil of both Arlington and Sunderland, so far as we saw it, was principally sandy, and light. The country was extensively covered with white pines; and the settlements were in the strictest sense new. The houses were chiefly small and ordinary; and the inhabitants plainly in indifferent circumstances. We passed, however, only through the skirts of these townships.

Arlington contained in 1790, 991 inhabitants; in 1800, 1,597; in 1810, 1,468.

Sunderland contained in 1790, 414 inhabitants; in 1800, 557, in 1810, 575.

Sunderland formerly was the residence of Colonel Ethan Allen: a man who as a prisoner excited some interest in Great Britain, and who for many years was notorious in the United States. This man was born at Salisbury in Connecticut. His education was confined, and furnished him with a mere smattering of knowledge; but his mind was naturally haughty, restless, and enterprising. Licentious in his disposition, he was impatient of the restraints either of government or religion, and not always submissive to those of common decency. In his conversation he was voluble, blunt, coarse and profane; in his pretensions to knowledge, daring; and in his assertions bold and peremptory. The confidence, which he seemed to possess in himself, naturally inspired confidence in others, still less informed; and they readily believed, that he, who asserted so positively must be sure, that his assertions were true. With these advantages, and these only, he early obtruded himself upon the public as an opposer, and ridiculer, of Christianity; and gloried in the character of an Infidel. A little circle of loose persons will always gather about a man of this description. "Qui fidit sibi, dux regit examen" is a maxim extensively applicable; but in no case more so, than where prof-

ligate principles have become necessary to shelter the character, and quiet the consciences, of licentious men. Allen was surrounded by a herd of such men: both parties being equally pleased: he, to be listened to as their oracle; and they to learn that a virtuous character was no better than a vicious one, and that God would punish vice neither here, nor hereafter. By his own companions he was heard with attention, and credit: and at times triumphed over modest antagonists by peremptoriness and effrontery, by rudeness and ribaldry. At length he assumed a bolder tone; and determined to become an instructor of the public. This was a fatal step. He neither understood the subject, nor knew how to write; and therefore, although not destitute of native talents, he appeared as a pigmy in the field of literary contention. He named his book the *Oracles of Reason*; after a wretched publication of Charles Blount, one of the pertest and weakest, of all the British Infidels; but probably Allen's favourite author; and not improbably the only one, whose works he had read. This was the first formal publication in the United States, openly directed against the Christian Religion. When it came out, I read as much of it, as I could summon patience to read. Decent nonsense may possibly amuse an idle hour: but brutal nonsense can be only read as an infliction of penal justice. The style was crude, and vulgar; and the sentiments were coarser than the style. The arguments were flimsy, and unmeaning; and the conclusions were fastened upon the premises by mere force.

In the bustling part of the American Revolution, Col. Allen made some noise. At the request of the Legislature of Connecticut, he marched, in May 1775, soon after the battle of Lexington, to attack the fortresses of Ticonderoga and Crown Point. At Castleton in this State he was joined by Col. Arnold; sent by the Massachusetts Committee of Safety to accomplish the same object. Arnold, however, was alone; but determined to join the expedition. They reached the ferry at Ticonderoga on the evening of the ninth; and, having with great difficulty procured boats, landed eighty-three men on the opposite shore during the night. At the head of these he marched to the gate of the fort; where a

sentinel snapped his gun at him, and retired. Allen immediately entered the fort, and formed his men upon the parade ; where they huzzaed, and roused the garrison. Allen proceeded immediately to the chamber of Captain De Laplace ; and, holding his drawn sword over his head while he was yet undressed, demanded the surrender of the fort. "By what authority?" said the Commandant. "I demand it," said Allen, "in the name of the great JEHOVAH, and the Continental Congress." The fort was immediately given up, together with its stores, and garrison : forty-nine in number. The same day they took Crown Point also ; and, soon after, a sloop of war ; the only armed vessel on Lake Champlain.

During the following autumn he went twice into Canada, to engage the inhabitants in the American cause. In the last of these expeditions he attempted, at the head of one hundred and ten men, to make himself master of Montreal ; but failed of his design, and was taken prisoner. Indeed, the enterprize was originally desperate ; and its success that, which a sober man must certainly have expected. He was met by the British with five hundred men ; and, after making the best defence in his power, and being deserted by most of his own men, of whom about eighty were Canadians, he surrendered himself as a prisoner. For some time he was kept in irons, and treated with much severity ; and was then sent to England, with an assurance, that he was destined to the halter. Here he continued scarcely a month, when he was sent back to Halifax. Thence, after five months confinement in prison, he was removed to New-York. On his passage a plot was formed to kill the Captain, and take possession of the frigate. It was proposed to Allen ; but he refused to join in it ; particularly, because he had been well treated by him. He continued at New-York a year and a half, and was then exchanged for Col. Campbell. After his return to Vermont, the State gave a public testimony to his merits, and sufferings by placing him at the head of the militia. He died suddenly, February 13, 1789, on his own estate in Colchester. He was thought by many persons to be a man of superiour talents : but for this character he

was indebted to the boldness of his sentiments, the peremptoriness of his decisions, and the paradoxical nature of his opinions.\*

Manchester is a pretty town, lying on the Battenkill; a branch of Hudson's river. This stream rises in Dorset, the next township above Manchester; and has heretofore received the waters of a spring, a part of which entered Lake Champlain by Otter creek, and thence was discharged in the gulph of St. Lawrence: while the remainder mingled with the ocean at Sandy Hook, below New-York: the distance between the two points being not far from a thousand miles.

Manchester is built on a single street, commencing near the foot of the mountain on the West, and lying along a beautiful plain for about a mile. The situation is rarely equalled, unless on the border of a considerable river, or of the ocean. The soil is inferior to that of Bennington and Shaftesbury. The houses are good farmers' dwellings.

The inhabitants of Manchester, like those of many other new settlements, are divided in their religious opinions; but with a catholicism, less common than could be wished, have generally agreed to employ, successively, preachers of the several denominations of religions in the town, whenever they could find those, against whose character, deportment, and preaching, there could be no reasonable objection. By this spirit of concession they

\* Dr. Elliot, who removed from Guilford in Connecticut, to Vermont, was well acquainted with Col. Allen, and made him a visit at a time when his daughter was sick, and near to death. He was introduced to the Library, where the Colonel read to him some of his writings with much self-complacency, and asked, is not that well done? While they were thus employed, a messenger entered and informed Col. Allen, that his daughter was dying, and desired to speak with him. He immediately went to her chamber, accompanied by Dr. Elliot, who was desirous of witnessing the interview. The wife of Col. Allen was a pious woman, and had instructed her daughter in the principles of christianity. As soon as her father appeared at her bedside, she said to him, 'I am about to die; shall I believe in the principles you have taught me, or shall I believe in what my mother has taught me?' He became extremely agitated; his chin quivered; his whole frame shook; and after waiting a few moments, he replied, 'Believe what your mother has taught you.'

For the facts in the preceding account, I am indebted to a gentleman of Killingworth, who received them from his kinsman, Dr. Elliot.—*Pub.*

have extensively secured to themselves, what otherwise would have been unattainable, the public worship of God.

Manchester contained, in 1790, 1,276 inhabitants; in 1800, 1,397; and, in 1810, 1,502.

From Manchester to Danby we took a road, on which traveling had recently been commenced. After turning North-East over the plain, on which Manchester is built, it resumed its Northern, and proper direction round the end of a mountain on the West, and entered a narrow defile between this and the Green Mountains. Our progress here, for several miles, was dark and dreary. The sun was hidden in a moment. Uncultivated, shaggy mountains, on both sides, forbade every excursion of the eyes. A swamp, with a brook, which flowed heavily from it, bordered our road on the East. The road itself was indifferent. The houses, apparently dropped down into this desert region, were few and solitary. The fields were thinly scattered, lonely, and half-cultivated: and the inhabitants appeared, as if they had fled to a place, where the world would never find them again.

The only object of curiosity, which we met with in this region, was a multitude of white stones, of very hard granite, thickly spread over a tract about a mile in length. They were all rounded, apparently by being long covered with water; and were the only specimens of granite which I had observed, after leaving the Green Mountains in Cornwall.

The inn, at which we terminated this desolate ride, was a humble one, but very welcome to us: especially, as it was inhabited by people who were very friendly and obliging.

The next morning, Thursday, September 26th, we rode to Rutland before dinner: twenty miles. Our journey lay along the principal branch of Otter Creek. The road differed little from that, which has been last described: but the mountain on the West, having terminated in Wallingford, we escaped from our defile into an open, and more agreeable, country.

Of Harwich, Dorset, and Wallingford, through the skirts of which the principal part of our progress was made, after we left

Manchester, I know nothing, except what I have already mentioned. Dorset, which lies on the other side of the Western mountain, and on the road formerly used, is said to be a pleasant, and considerable town. Clarendon lies immediately South of Rutland, at the foot of the Green Mountains. It presented to us several good houses ; a decently appearing church ; several mills ; a number of promising farms ; and other appearances of prosperity. These observations are, however, made from memory, for I find, that I have taken no notes concerning either of these townships.

Dorset contained in 1790, 958 ; in 1800, 1,286 ; in 1810, 1,294 inhabitants.

Harwich contained in 1790, 165 ; in 1800, 153 ; in 1810, 209 inhabitants.

Wallingford contained in 1790, 536 ; in 1800, 912 ; in 1810, 1,386 inhabitants.

Clarendon contained in 1790, 1,478 ; in 1800, 1,789 ; in 1810, 1,797 inhabitants.

During this journey, we lodged at an inn, where we found, what I never before saw in New-England, a considerable number of men, assembled on Saturday evening, for the ordinary purposes of tavern-haunting. They continued their orgies until near two o'clock in the morning ; scarcely permitting us to sleep at all. Early the next morning, these wretches assembled again, for their Sunday morning dram, when we left the inn, and went to a neighbouring house, as early as possible, disgusted with the manners of so irreligious a family. I am, Sir, yours, &c.

## LETTER V.

Rutland—Judge Williams—Pittsford—Brandon—Leicester—Salisbury—Middlebury—Marble quarry—Middlebury College—Woodstock—Barnard—Stockbridge—Rochester—Hancock—Ripton.

*Dear Sir,*

THE settlement of Rutland commenced about the year 1785; and furnishes a very honourable proof of the industry, and enterprise, of the inhabitants. The situation is a beautiful plain, in a handsome, open expansion, at a sufficient distance from the Green Mountains to furnish a fine, uncrowded view of them, and limited on the West, very pleasantly, by a range of hills, moderately elevated.

The soil of Rutland is somewhat inferiour to that of Bennington; but is still excellent. Iron ore is found, extensively, both here, and in the neighbourhood; as is also pipe clay; of which, it is said, crucibles have been successfully formed. The township is settled, throughout, in scattered plantations. The town consists, principally, of a single street, not far from a mile in length. Several of the houses are handsome; and the whole group well-appearing. The church, which was early erected, is an ordinary building; and the court-house (for Rutland is a County town) decent. Every thing, indeed, wears the appearance of ease and prosperity.

We spent our time very agreeably at the house of Judge Williams, until Friday morning. This gentleman being since dead, it will not be improper to remark, that he raised himself by the dint of his own well-directed efforts, to a useful station, and a very respectable character, in society. Plain and unaffected in his manners, he possessed a sound understanding, immovable integrity, and an elevated public spirit. Perhaps no man in the circle, in which he lived, enjoyed more entirely the confidence of his countrymen. A little before his death he was honoured with a numerous suffrage, as a candidate for a seat in the National Le-

gislature. He died of an injury, received by being thrown out of his sleigh. In his life, and in his death, he exhibited unquestioned proofs of genuine piety, and has left behind him an unstained and honourable character.

Rutland contains two parishes. West-Rutland, the second parish, is remarkable for having a regular minister, who is a man of colour. This is the first instance of the kind, which has ever existed in New-England.

Rutland contained, in the year 1790, 1,407 inhabitants; in 1800, 2,125; and, in 1810, 2,379.

We left Rutland on Friday morning; and rode to Middlebury, through Pittsford, Brandon, Leicester, and Salisbury: thirty-two miles. The road lies wholly along Otter Creek. It is little wrought, and of course indifferent; and the last part of the distance for about eight miles, was to us dangerous. The soil, here, is clay; and the season had been wet. Wherever the water lies, and particularly wherever a rill crosses the path, it becomes speedily soft, and ultimately a quagmire; the sides of which are perpendicular, like those of a pit. Into these places a horse descends as suddenly, as into a crack in a sheet of ice; and exposes both himself and his rider to the most dangerous evils. We left Rutland late in the morning; and were obliged to accomplish this part of our journey in the night. The heavens were overcast with clouds; the darkness was early, and intense; and our road passed through a thick forest. With a snail-like progress, therefore, we trembled through this part of our way until we arrived at Middlebury.

We crossed the skirts of the towns, mentioned above. In Pittsford we met with a few good farmers' houses. In the others, Brandon, Leicester, and Salisbury, log-houses, which we had hardly seen at all since we entered the State, except in the defile between Manchester and Rutland, began to multiply upon us. Barns also, causeys, and bridges, constructed of the same material, and other proofs of an incipient cultivation, were comparatively numerous. Pines abounded on the road; and the soil was chiefly light, and indifferent.

Pittsford contained in 1790, 850, in 1800, 1,413, in 1810, 1,936 inhabitants.

Brandon contained in 1790, 637; in 1800, 1,075; in 1810, 1,375 inhabitants.

Leicester contained in 1790, 343; in 1800, 522; in 1810, 609 inhabitants.

Salisbury contained in 1790, 446; in 1800, 644; in 1810, 709 inhabitants.

We arrived at Middlebury in the evening.

Middlebury, the shire-town of the County of Addison, lies on both sides of Otter Creek. This river rises in Bromley, on the North side of the County of Bennington; and runs North-West a course of ninety miles; crossing the Counties of Rutland and Addison, and discharges its waters into Lake Champlain. It is navigable to the foot of the falls in Vergennes, eight miles, for sloops of seventy tons. Above these falls, eight miles farther, and above the falls at Middlebury, to Rutland, it is boatable. At Middlebury it is from twelve to eighteen rods wide; and at Vergennes thirty-eight. Above Middlebury the current is remarkably sluggish: and the banks low, unpleasant, and often overflowed. Both the stream, and its borders were to my eye wild, solitary, and gloomy. The Savages, employed by the French government to make incursions into the Western parts of New-England, went up this river to its source; and then down, either West, or Deerfield, river. They could not have chosen a rout, better suited to the gloomy purposes, and lowering revenge, of a Savage bosom. The scenery, which struck me so forcibly, will, however, vanish with the increasing settlement of the country; and the river itself, in consequence of a cut, which has since been made in the Middlebury falls, will less frequently overflow its banks, and exhibit a more sprightly current.

The township of Middlebury began to be settled about the year 1788 in scattered plantations. About 1794 the inhabitants began to build a village on both sides of the river, at the falls in the North-West part of the township. The number of houses, when we were on the spot, was perhaps thirty. Several of them were pretty buildings.

The soil of Middlebury, and of a large part of this State on the Western side of the mountains, is clay, of a soft and friable texture, and of a light brown hue, often faintly tinged with red. Clay to me, is always gloomy and disagreeable. In wet seasons every rain converts it into mud. Whenever the weather is dry, it is pulverized wherever mankind live, and move : and the dust, being very fine and light, rises with every wind ; fills the air with clouds ; covers the houses, and soils the clothes, with a dingy, dirty appearance. When the surface of well-made roads has become hard, a slight rain makes them so slippery, as to be impassable with safety, unless with horses corked in the same manner, as when they are to travel on ice. The clay here, however, is extremely productive ; and yields grass, wheat, and almost every other object of agriculture, found in this climate.

The falls, at this place, descend twenty-one feet perpendicularly ; and are formed by a ledge of marble. The rapids are continued four miles down the stream. A bridge, built just above the falls, unites the parts of this village.

Several mills had been erected at this spot in 1798. A brewery was established ; several stores had been built ; a considerable number of mechanics, and several gentlemen in the liberal professions had chosen this spot as their residence. An academy also was nearly completed, which was intended to be the germ of a future college. Upon the whole, the seeds of future respectability were already sown here.

The evening of the 30th I spent in company with a number of gentlemen in a consultation concerning this projected seminary, at the house of S. Miller, Esq. They informed me, that a college was already incorporated in the State, the intended seat of which was to be Burlington ; that it had been incorporated some years, and was liberally endowed ; but that for various reasons, which were specified, nothing material had been done towards carrying it into operation ; that, although some indecisive efforts had been made by the Trustees soon after their appointment, all its concerns had, for a considerable time, been at a stand ; that there was, now, less reason to expect any efficacious efforts from

these gentlemen, than there had been heretofore ; as they themselves appeared to have relinquished both exertion and hope. The gentlemen then explained to me their own views of the importance of such an institution to their State ; the propriety of making this town the seat of it ; their own intentions ; and the wishes of many respectable people in the State, who coincided with them, in the opinions, which they had expressed to me. When they had unfolded their views, I frankly communicated to them my own ; and have since had no reason to complain, that they were disregarded. I will only add, that the local situation of Middlebury, the sober and religious character of the inhabitants, their manners, and various other circumstances, render it a very desirable seat for such a seminary.

I have already remarked, that in the year 1806 I took a second journey into the Western parts of Vermont. I left New-Haven, Tuesday, September 16th, in company with Rev. Mr. S. and Mr. D. both of New-Haven ; and arrived at Williamstown the following Friday. The next day we set out for Cambridge in the State of New-York ; and, having passed through Pownal, Petersburg, and Hoosac, reached Cambridge in the evening. Very early the next morning, there being no public worship in Cambridge, we rode into Salem ; eleven miles ; and the next day reached West-Haven, through Hebron, Granville, Hampton, Pulteney, and Fair-Haven : thirty-five miles. The next day we reached Middlebury, through Benson, Orwell, and Cornwall : thirty miles.

In May, 1810, I ascended Connecticut river as far as Windsor. Thence I crossed the country in a new turnpike road ; and reached Middlebury on the 25th of the month. The country, which I passed between Williamstown and Middlebury, in the former of these journies, I shall have occasion to describe hereafter. In the latter I had an opportunity of observing the progress of blossoming on the apple-tree through a circuit of four hundred and fifty miles. When I left New-Haven, the blossoms were on most trees completely opened. At Hartford, they appeared to be about two days earlier than at New-Haven ; at Northampton, about two days later ; at Northfield, one hundred and ten miles

North of New-Haven, five days later; at Keene, twelve days later, although Keene is but twenty-one miles from Northfield, and lies in a valley upon very nearly the same elevation. At Windsor, one hundred and sixty miles above New-Haven, they were of the same date as at Keene. On the hills between Windsor and Middlebury, they were a month later than at New-Haven. At Middlebury, two hundred and ten miles North of New-Haven, the blossoms were only ten days later; at Stockbridge, (Mass.) seventy-eight miles, fourteen days; at Litchfield, in Connecticut, thirty-six miles, seventeen.

The road between Windsor and Middlebury is generally good. After passing over the hills between Windsor and Woodstock, it ascends for several miles one of the branches of the Waterqueechy. Thence it crosses another collection of hills to the Southern branch of White river; and ascends this stream almost to the summit of the Green Mountains. After crossing this ridge, it follows, to the plain below, a branch of Otter Creek, which passes through the township of Middlebury. From the foot of the mountains to Middlebury, it lies principally on a plain.

The region between Windsor, and the ridge of the mountains, is principally composed of high elevations, separated by sudden deep, and narrow, vallies, watered regularly by clean and very sprightly streams. The town of Woodstock is built at the junction of two branches of the Waterqueechy, at the distance of fourteen miles from Windsor; and is the only town, through which we passed. It is a neat, cheerful settlement, containing a number of handsome houses, and ornamented with intervals on both streams. Woodstock is settled throughout, principally in plantations; and contained, in 1790, 1,605 inhabitants; in 1800, 2,130; and, in 1810, 2,672. From Woodstock we passed through the skirts of Bernard, Stockbridge, Rochester, Hancock, and Ripton. The whole country, being composed, however, of the borders of townships, exhibited much the same general face; except Ripton, which lies on the plain. The forests are beech, maple, &c. The soil, until we began to descend the mountains, was gravelly loam; and then speedily became clay. Most of this country is,

however, settled, on the hills; where the soil yields excellent meadows, and pastures. Maize grows well; but is sometimes cut off by early autumnal frosts. Wheat and rye, also, prosper where the ground is not too wet.

Barnard contained in 1790, 673; in 1800, 1,244; in 1810, 1,648 inhabitants.

Stockbridge contained in 1790, 100; in 1800, 424; in 1810, 700 inhabitants.

Rochester contained in 1790, 215; in 1800, 523; in 1810, 911 inhabitants.

Hancock contained in 1790, 56; in 1800, 149; in 1810, 311 inhabitants.

Ripton contained in 1810, 15 inhabitants.

The rocks on the Eastern side of these mountains are chiefly a shining schist; coarse; of a dull blue; and often stained with iron rust. This kind of stone extends through a great part of the distance to the summit of the mountains; but is interrupted in various places by granite, and sand-stone. The strata were every where oblique. Ten or twelve miles before we came to Middlebury, we saw in several places a species of stone, resembling rotten-stone. Its colour was very near that of umber, after it is burnt. On the surface the texture was frequently dissolved; and the decayed parts resembled the substance, called punk, except that it was of a darker hue.

On these mountains I observed, for the first time, the mountain elder; a shrub not inferior in beauty to many of those, which are used to ornament court-yards, and shrubberies. The leaf is of a handsome, deep green; long, sharply pointed, and denticulated. Its blossom is made up of a very numerous collection of small flowers, forming a ball of an oval figure, and of a sprightly buff. Here, also, I first observed the black-moose bush: a pretty shrub with a rich pulpy leaf, and a tuft of brilliant white flowers at the end of every branch. The berry, produced by this shrub, is said to be pleasantly flavoured.

From the summit of the mountains, limestone begins to prevail towards the West.

In both these journies, and particularly in the latter, I found Middlebury changed into a beautiful town, consisting of about one hundred and fifty houses. The inhabitants have finished a large and handsome church. The private buildings are generally neat, and in several instances handsome. The town contains a book-store, a printing-office, twelve or fifteen stores belonging to merchants and druggists, and a great number of mechanics' shops. A quarry of marble has been discovered in the bank of the river, just below the bridge; a continuation of the ledge, which forms the fall. It is both white, and dove-coloured, elegantly variegated, and of a finer texture than any other, which has been wrought, hitherto,\* in the United States. It is sawn, ground, and polished, by water machinery; and is cut, and carved, with an elegance, not surpassed on this side of the Atlantic.

The academy, which I have mentioned above, began to prosper from the time, when it was opened; and was, in the year 1800, raised by an Act of incorporation into a College. From that time to the present, (1811,) it has continued to prosper; although all its funds have been derived from private donations, and chiefly, if not wholly, from the inhabitants of this town. The number of students is now one hundred and ten; probably as virtuous a collection of youths, as can be found in any Seminary in the world. The Faculty consists of a President, a Professor of law, a Professor of mathematics and natural philosophy, who teaches chemistry also, a Professor of languages, and two Tutors. The inhabitants of Middlebury have lately subscribed 8,000 dollars for the purpose of erecting another collegiate building. When it is remembered, that, twenty-five years ago, this spot was a wilderness, it must be admitted, that these efforts have done the authors of them the highest honour.

At the same time, religion has prevailed in this town more than in any other in the State; and controuls very obviously the manners, and the character, of the inhabitants, in a degree uncommon and delightful. Its influence is very happily seen in the College; where the best order prevails, under a discipline, exact in-

\* 1811

deed, but mild and parental. Upon the whole, Middlebury is one of the most prosperous, and most virtuous, towns in New-England.

This township includes but one Congregation; and, in the year 1790, contained 395 inhabitants; in 1800, 1,263; and in 1810, 2,188.

I am, Sir, yours, &c.

## LETTER VI.

Weybridge—New-Haven—Vergennes—Settled by Col. Allen—Prospect from the  
State-House.

*Dear Sir,*

WE left Middlebury for Vergennes on the morning of October 1st, 1798, in company with Colonel S——, and arrived at 12 o'clock. In this part of our journey we passed through the townships of Weybridge, and New-Haven; both settled in scattered plantations. The soil is clay, of a good quality; and the inhabitants are in comfortable, thriving circumstances. A part of the road along Otter Creek is good; the remainder is hilly and rough.

The people of Weybridge have lately built a handsome church; (1806,) and religion is in a flourishing state in this little township.

Vergennes is situated on Otter Creek at New-Haven falls; thirteen miles from Middlebury. It is exactly a mile square; and was taken from the two townships of New-Haven and Ferrisburgh. When Col. Ethan Allen returned from his captivity, he determined to raise up a city in the State of Vermont: and this was the spot which he selected. It was accordingly incorporated, and named Vergennes, after the Count De Vergennes: whom ardent, uninformed, and short-sighted, Americans, at that time, believed to be a friend to this country. It is governed by a Mayor, Alderman, and Common Council.

A traveller is compelled to laugh at this freak of Col. Allen. Nothing furnishes any man, whether thinking or unthinking, the least reason to believe, that a city, in the common acceptation of the term, could possibly be raised up on this spot. It was, indeed, intended for the seat of government; and so are half a dozen other places. Whether any of them will ever become what they so ardently covet; whether there will be a seat of government in the State; or whether the Legislature will continue to roll upon wheels from town to town, as they have hitherto done; no human foresight can determine. The Legislature itself has been at least equally freakish with the projector of this city; and seems at present little more inclined to settle, than any other bird of passage. It may, as common sense would direct, pitch upon two

of the most considerable towns in the State, one in the neighborhood of Connecticut river, and the other of Lake Champlain, as the permanent places of its sessions: for example, upon Burlington and Windsor. Or it may plant itself, finally, upon the range of mountains, which separates them; and make the seat of government disgusting to all, who resort to it, and odious to all, who by their offices are compelled to make it their residence.

The claim of this place can be supported by no peculiarly favourable circumstances. The country behind it will never come hither for trade. Otter creek is, indeed, navigable to this spot: but it is so winding, as to render the navigation of no importance. The only considerable advantage, found here, is derived from the falls: a most convenient seat for every species of water-works.

When I visited this place in 1798, I found a minister already settled; and soon after his removal to the Presidency of the College at Burlington, the people speedily settled another. Divine service was celebrated in a house, built here for the accommodation of the Legislature.

From the cupola of this building a very noble prospect was presented to us. Eastward, we beheld the Green Mountains, stretching little less than one hundred miles from North to South. Westward, three ranges, rising in parallel ridges beyond Lake Champlain, the second higher than the first, and the third towering above the second, extended in the same direction through a distance equally great. The vast length of these ranges; the loftiness of their elevation; the wild variety of their summits, here arched, there waving, now obtusely, now acutely conical, and now disdain- ing all approach to any regular figure; the gloomy extent of the forests, which overspread their bosoms; the valley between them, expanding over a breadth of thirty, forty, and fifty miles; and the magnificent lake at the bottom; constituted a scene of grandeur and sublimity, rarely paralleled on this side of the Atlantic.

Weybridge contained in 1790, 175; in 1800, 502; and, in 1810, 750 inhabitants.

New-Haven contained in 1790, 723; in 1800, 1,135; and, in 1810, 1,688 inhabitants.

Vergennes contained in 1700, 201; in 1800, 516; and, in 1810, 835 inhabitants.

I am, Sir, yours, &c.

## LETTER VII.

Ferrisburgh—Charlotte—Shelburn—Burlington—College—Prospect from Burlington—Colchester—Milton—Georgia—St. Albans—Swanton—Highgate.

*Dear Sir,*

IN my journey, in the autumn of 1806, I explored the State of Vermont through a considerable part of its Northern extent. My companions left me at Middlebury, on Wednesday morning, September 24th to visit Crown Point. In the afternoon I rode in company with two gentlemen, whom I casually found, and who proved very agreeable companions, to Vergennes. Messieurs S—, and D—, had reached Vergennes before me.

We left this place in the morning; and proceeded to Burlington, through Ferrisburgh, Charlotte, and Shelburne: twenty miles. These three townships, so far as we saw them, are mere collections of farms. The land in the two former is generally good, and the surface a succession of hills and vallies. What is uncommon, where such a surface exists, in New-England, brooks and springs appeared to be rare.

Charlotte is a beautiful township. The hills slope in the most graceful manner; the vallies are easy and elegant; the vegetation is rich; and the prospect of the two great ranges of mountains, the lake and the adjoining country, is highly finished. Few settlements, not farther advanced, present such a collection of fine scenes. The inhabitants of this township are, obviously, advancing fast in prosperity.

Ferrisburgh, contained in 1790, 481 inhabitants; in 1800, 956; in 1810, 1,647.

Charlotte, contained in 1790, 635 inhabitants; in 1800, 1,231; in 1810, 1,679.

Shelburne, contained in 1790, 389 inhabitants; in 1800, 723; in 1810, 987.

The split rock, on lake Champlain, sometimes mentioned in the history of the Revolutionary war, stands immediately Westward of Charlotte.

We reached Burlington before dinner.

Burlington is situated one hundred and forty-three miles North of Williamstown, and two hundred and fifty-five from New-Haven, in  $44^{\circ} 29'$  North latitude, and  $73^{\circ}$  West longitude from London. The site of this town is uncommonly beautiful. It is an extensive slope, ascending gradually from lake Champlain three fourths of a mile. The part of the lake, by which it is bordered, is a noble bay, about four miles in depth, and to the eye an exact semi-circle. The ascent to the East is nearly uniform; and, except that it is disfigured by two disagreeable ravines, (one of them of considerable breadth and depth) which wind across it from the North-East to the South-West, is unusually handsome. This slope was originally covered chiefly with pines. The soil is coarse, sandy, dry, and warm; furnishing dry streets, and excellent gardens. Two streets ascend from the lake to the summit of the slope, and, are crossed by others at right-angles. Ultimately, the whole ground is to be formed into regular squares; and new streets are to be opened as occasion may require. The plan is excellent; and will, I think, be exactly accomplished. An open square is formed in front of the court house, which faces the lake at the distance of about half a mile. A similar square is soon to be formed in front of the college. The principal part of the buildings stand in four groups; one erected on two streets near the water; a second around the court house; a third in the neighbourhood of the college; and a fourth on the North street. The number of houses is calculated at 150; and 100 more are probably scattered through the township, upon farms. Many of them are ordinary buildings; many of them neat and good; and several are handsome. The court-house is an indifferent structure; used at times, both for Courts and religious assemblies, but convenient for neither.

The college is a copy of those at Princeton, Providence, and Dartmouth; but is handsomer than either of them. It is 140 feet in length, and of four stories. The number of students, when we were on the ground, was said to be about thirty. The President is the only Instructor. The first public Commencement was held about a fortnight before our arrival; when six students took the degree of A. B.

The commerce of Burlington is greater, I suspect than that of any other town in this State. It is carried on with Boston, New-York, Troy, Montreal, and Quebec. Lumber, floated principally to Quebec, is one of the most considerable articles.

Burlington is a port of entry.

Eleven years since, there was scarcely a house in this township, except in Water street, a small number in Second street, and perhaps half a dozen on the farms of the interior. All these were probably worth less than one, out of several mansions, standing here at the present time.

Splendour of landscape is the peculiar boast of Burlington. Lake Champlain, here sixteen miles wide, extends fifty miles Northward, and forty Southward, before it reaches Crown Point; and throughout a great part of this magnificent expansion is visible at Burlington. In its bosom are encircled many beautiful islands; three of them, North and South Hero, and La Motte, sufficiently large to contain, the first and last one township each, and the other, two; forming, together with the township of Alburgh, on the point between the bay of Misciscoui and the river St. John, the County of Grand Isle. A numerous train of these islands are here in full view. In the interior, among other interesting objects, the range of the Green Mountains, with its train of lofty summits, commences in the South with the utmost stretch of the eye; and limiting, on the East, one third of the horizon, declines far Northward, until it becomes apparently blended with the common surface. On the West, beyond the immense field of glass, formed by the waters of the lake, extends the opposite shore from its first appearance at the South, until it vanishes from the eye in the North-West, at the distance of forty miles. Twelve or fifteen miles from this shore ascends the first range of Western Mountains; about fifteen or twenty miles further, the second range; and, at about the same distance, the third. The two former commence a few miles South of the head of lake George; one on the Eastern, and the other on the Western, side of this water. Where the third commences I am ignorant. The termination of all these ranges is not far from the latitude of Plattsburg. The prospect of these mountains is superlatively noble. The rise of the first

range from the lake, the ascent of the second far above it, and the still loftier elevation of the third, diffuse a magnificence over the whole, which mocks description. Three of the summits, hitherto without a name, are peculiarly distinguished for their sublimity. Among those of the Green Mountains there are two, in the fullest view from this spot, superiour even to these. One of them, named the Camel's Rump, the Camel's Back, and the Camel; the other the Mountain of Mansfield. The latter of these, was by the following expedient proved, not long since, to be higher than the former. A hunter, who had ascended to its highest point put into his piece a small ball; and pointing it at the apex of the Camel, the ball rolled out. Both of them are, however, very lofty; higher, as I believe, than Killington Peak, notwithstanding the deference, with which I regard the estimates of Doctor Williams. The peculiar form of the Camel's Back invests this mountain with a sublimity, entirely superiour to any other in this State.

Burlington has been generally thought to be unhealthy. The inhabitants, however, deny this charge. The present year they have been distressed by the dysentery; which was just terminating at our arrival. There is nothing in the situation to render it unhealthy, unless it be a low, marshy ground, at some distance, near the lake.

From various accounts given by the inhabitants, its surface, especially towards the lake, must be very different from what it was anciently. Frogs have been dug up here at the depth of fifteen feet. At first, they were apparently lifeless; but, after being exposed for some time to the air and sun, became convulsed and tremulous; and, gradually acquiring more and more the power of voluntary motion, finally hopped away in full possession of health and activity.\* Logs also, and stumps of trees, have been dug up here at various depths, from ten to forty feet; and this, in some instances, where no discernible alluvion could explain the mystery. About three miles from the Court-house, and within fifteen rods of Onion river, a man about six years since, while digging a well, found a boat, twelve feet below the surface. I tried, but in vain,

\* Similar facts have taken place in the States of Massachusetts, New-York, and Connecticut.

to get a description of this boat. The subject was a nine-days wonder, and was then forgotten. We passed by the well; but could discern nothing in the ground to distinguish it from that in its neighbourhood.

Since this was written, a considerable change has taken place in the people of Burlington. They have settled two ministers; and have formed themselves into two congregations. It may be reasonably hoped, that their efforts will produce serious benefits to themselves, and their posterity. In 1790, Burlington contained 332 inhabitants; in 1800, 815; and, in 1810, 1,680.

Friday afternoon, September 26th, we left our horses at Burlington; and, taking a pleasure-waggon, rode to St. Albans, through Colchester, Milton, and Georgia: twenty-seven miles. The road through Colchester lies on an extensive pine plain, divided by deep ravines, which streams of no great size have worn down, during a long succession of ages. The descent into these chasms is steep, long, and difficult. Elsewhere we found the road, considering the recency of the settlements, a good one.

The soil of that part of Colchester, through which we passed, was light and sandy. Near the lake, it is said to be excellent. In Milton we passed through a handsome, open valley, covered with a rich soil. The lands in Georgia are still richer, and more beautiful. Those in St. Albans, also, are particularly handsome, and very fertile. We saw a very pretty church in Georgia; the more beautiful, as it was erected in a country, so lately a wilderness.

The river La Moille crosses the road in Milton. This stream is somewhat less than Otter Creek. It rises in the township of Glover; and, crossing the principal part of the State, falls into Lake Champlain in Colchester. Its waters, like those of Otter Creek, are tinged with a brown colour. Its course is about eighty miles.

The last yellow pines, which we saw in our route, and the last oaks, were on the plains of Colchester. Here, if I mistake not, we saw the last white pines also. All these trees, however, grow not only farther North in this State, but in Canada.

The inhabitants of these townships, notwithstanding the recency of their settlements, are generally in comfortable circumstances.

The climate on this lake is sensibly milder than in the same latitudes on Connecticut river. The spring commences earlier; the winter later. The snow falls in less quantities; and the seasons are, upon the whole, generally more pleasant. Fruits, also, thrive here, which there, in the same latitude, are brought forward with difficulty. The tender plants are here defended from late vernal, and early autumnal frosts, by mists, exhaled from the lake; which spread extensively over its borders; and, returning the heat very gradually to the frozen plants, prevent them from being injured.

Colchester contained in 1790, 137; in 1800, 347; in 1810, 657 inhabitants.

Milton contained in 1790, 282; in 1800, 786; in 1810, 1,546 inhabitants.

Georgia contained in 1790, 340; in 1800, 1,068; in 1810, 1,760 inhabitants.

St. Albans contained in 1790, 256; in 1800, 941; in 1810, 1,609 inhabitants.

Swanton contained in 1790, 74; in 1800, 856; in 1810, 1,657 inhabitants.

Highgate contained in 1790, 103; in 1800, 437; in 1810, 1,374 inhabitants.

We returned to Burlington on Saturday; where we continued until Monday morning. Our original design had been to proceed to the forty-fifth degree of latitude; but we could obtain no other vehicle beside our waggon; and this we were obliged to return on Saturday. The distance from St. Albans to the line is about sixteen miles; divided between that township, Swanton, and Highgate. The two last townships, we were assured, were copies of those, through which we had passed; but somewhat more recently settled.

The surface of Canada, bordering on this part of Vermont, is made up of plains, or easy swells; both of them fertile. Many New-England settlers have already begun to occupy these lands; having obtained them of the government for little or nothing: and their number is yearly increasing. There are also several extensive swamps between the line and St. John's.

I am, Sir, yours, &c.

## LETTER VIII.

Essex—Jericho—Bolton—Waterbury—Observations on the attempts of modern Philosophers to disprove the Mosaic era of the Creation—Onion river.

*Dear Sir,*

SEPTEMBER 29th (Monday,) we took our horses, and proceeded up Onion river to Middlesex, through Essex, Jericho, Bolton, and Waterbury: thirty-four miles. The road lies wholly along the river, and chiefly on its banks. It is recent, and little wrought; yet, except where it passes over two or three rough hills, is tolerably good. A small part of the distance it proceeds through forested ground; most of which was rendered particularly pleasant, by a multitude of beautiful and lofty white pines, with which it was covered. A great part of the tract, through which our journey lay, is however, thinly settled, and wears every mark of a recent colonization: such as houses, and fences, built of logs; girdled trees; stumps; and fields imperfectly cleared.

In Jericho we passed by a beautiful plantation, formerly the property of Governor Chittenden; now of Major General Chittenden, one of the members of the American Congress.

This day's journey was fraught with a rich variety of beautiful scenery. The river is a pleasant stream, perfectly clear, and strongly resembling the waters of the Saco; always elegantly winding; cheerful in its current; and awakening the most lively impressions of sweetness, and salubrity. Its borders, also, are lined with intervals, remarkably handsome, and fertile. The crops which were still on the ground, and the remains of those which had been gathered, particularly the stubble of the wheat, were vigorous and abundant. The verdure of the numerous and rich meadows, every where bordering our road, was exquisite. The forest-trees were thrifty, and noble. The hills, presenting, frequently, handsome acclivities, shewed us many rich farms, advancing rapidly towards a thorough cultivation. Often behind them, and often rising immediately from the road, objects, invest-

ed with awful grandeur, were finely contrasted with this smiling scenery. On the North side particularly, a long succession of naked rocks, and stupendous precipices, principally schistus, formed wild, ragged, and magnificent counterparts to the rude mountains on the Eastern continent, as exhibited in plates and descriptions. On the Southern side of the river the mountains are universally forested. Even the Camel's Back, which at little intervals is visible all along this road, and looks down on the regions below with proud sublimity, is covered with evergreens to its summit.

It is impossible for a person, travelling through this cleft of the Green Mountains, not to experience the most interesting emotions. The unceasing gaiety of the river, and the brilliancy of its fine borders, create uncommon elasticity of mind, animated thoughts, and sprightly excursions of fancy: while the rude and desolate aspect of the mountains, the huge, misshapen rocks, the precipices, beyond description barren and dreary, awaken emotions verging towards melancholy, and mild and elevated conceptions. Curiosity grows naturally out of astonishment; and inquiry of course succeeds wonder. Why, the mind instinctively asks, were these huge piles of ruin thus heaped together? What end could creative wisdom propose in forming such masses of solid rock, and accumulating such collections of bleak and barren mountains; unfit for habitation, and apparently useless to man? Several thousands of years these piles have already existed; and have hitherto accomplished no conceivable end, but to shelter the wolf, or the bear; or to furnish a passage, or a den, to the prowling savage; or to yield an asylum to the small and timorous tribes of mankind from the invasions of the powerful and heroic.

Wild and mountainous scenes have engrossed the attention of men in all ages. To poets, and among others to the poetical savage, they have ever been commanding objects; and have fascinated the imagination with their rude sublimity, and awful grandeur. In modern days, philosophers, under the influence of a fancy little less engrossed, have explored these lofty desolate regions for purposes, which escaped the research of antiquity. They have found, or imagine they have found, in their dark re-

cesses, the means of elucidating many important and difficult questions of science. From examining the contexture, materials, and relative positions, of the different parts of these masses, they have undertaken to form peremptory decisions concerning the origin, date, and changes, of the globe, and the agents, to which they ought to be ascribed. If we are to believe their declarations, they have here discovered proofs, that the world was in being long before the Mosaic era of the Creation; and that it was formed in a very different manner, and by very different means, from those assigned by Moses.

Recupero is not the only man, who has made a new register of the age of the earth from the information of mountains; nor is lava the only species of record, whence its Chronology has been derived. Yet I think Recupero had more plausible data for his opinion, than has been found by the whole body of these philosophers united; and could allege more satisfactory evidence for the conclusion elicited from him, or perhaps made for him by the ingenious Brydone.

To the investigation of subterranean geography there are many rational motives, and no objections. The only difficulty in the way of these philosophers is that, which has always opposed the pleasant employment of making theories. The facts are either too few, or too imperfectly known, to furnish a solid basis for their systems. Hence, it frequently happens, that, after the scheme is nicely formed, and splendidly penned, a new fact suddenly starts up to the knowledge of mankind, which, like the stone in the prophecy, smites the magnificent image; and in spite of the richness of the materials, and the firmness with which they were put together, reduces all its gold, and silver, and iron, and brass, to dust.

In these wild and elevated regions the fancy of the philosopher is much more awake, than his intellect. The suggestions of his mind, the very arguments which he uses, and the conclusions on which he fastens, instead of being the sound emanations of logic, are mere effusions of poetry; and need nothing to complete this character, except to be written in verse.

Were they thus written, all thinking men would readily perceive them to be fictions. In the garb of sober prose, and with

the aid of abstract phraseology, they wear the appearance of sense and wisdom ; and become darling objects to a curious and excursive mind, with as good reason, as Minerva herself could allege for selecting her favourite bird.

Of making inquiries of this nature there is no end. Nor is there any limit to the objections against truth, which such inquiries will easily furnish. A little child can ask questions, which no philosopher can answer. An atom presents difficulties in the path of investigation, which no philosophy can explain. A vigorous and adventurous mind will ever discover many things, which escape the attention of others ; and will wander with an animated spirit of research, where others are listless, or discouraged. In all its roving it will regularly seize on those facts, which most invite its curiosity, flatter its prejudices, or support, or seem to support, its favourite systems. It will, therefore, incline, of course, one way only, until the flexure becomes by habit too rigid to admit any alteration. Things, which are perfectly equivocal will then furnish strong presumptions in favour of its preconceived dogmas ; and faint probabilities will, by a familiar alchymic process, be converted into demonstrations. The very nature of facts themselves will be misconceived ; the evidence, which they present misconstrued ; and the whole current of reasoning diverted from its proper channel. In these circumstances, a vivid fancy, fired with the magnificence of great and splendid objects, and lost amid their multifarious complication, will, with the aid of a little ingenious and obsequious logic, build the Universe a second time ; and will see all its materials spontaneously arranging themselves to support the visionary fabric.

Onion river furnishes several romantic scenes. At Burlington falls, about two miles from the Court-house, it has worn the ledge of limestone, over which it pours in a torrent, into every wild and grotesque form. Some years since, a man and a boy were driven down these falls. Beyond all probability and all hope, the man escaped with life ; and the boy, without even a wound. At Stanton's bridge, two miles up the stream, it has forced a passage through a huge mass of limestone, about fifteen rods in length. The precipices are perpendicular, and lofty. That on

the South side is from seventy to one hundred feet in height. The river is here about fifty feet wide ; and is said to be seventy feet deep. At Waterbury falls, it has worn a stupendous passage through two mountainous promontories of slate, between six hundred and a thousand feet in length. The precipices, on both sides, are lofty. The perpendicular height of that on the South, is not less than one hundred and fifty feet. A collection of huge misshapen rocks has here been tumbled into the river ; and, when it is at its usual height, completely covers its bed. The gloominess of this passage ; the pile of ruins, beneath which the river runs : the noise of the torrent ; and the solemn grandeur of the precipices ; form a combination of scenery, which a Welsh, or Highland bard would have described with rapture. In Middlesex there is another interesting scene of the same kind : but as we passed it in the evening, I was unable to examine it. As this river has most of its course between hills and mountains, it is changed by every copious rain into a desolating torrent. Of its ravages we had many proofs in our journey.

The estate of the Hon. Mr. Chittenden is the most beautiful spot on its banks ; and probably one of the most fertile in the American Union. To a person, satisfied with rural solitude, it must be a charming residence.

The whole of this day's journey lay on the borders of the townships, through which we passed. There is a little village at Waterbury, containing perhaps 30 houses, evidently built within the last four or five years.

Essex contained in 1790, 354 ; in 1800, 730 ; in 1810, 957 inhabitants.

Jericho contained in 1790, 381 ; in 1800, 728 ; in 1810, 1,185 inhabitants.

Bolton contained in 1790, 88 ; in 1800, 220 ; in 1810, 249 inhabitants.

Waterbury contained in 1790, 93 ; in 1800, 644 ; in 1810, 966 inhabitants.

Middlesex contained in 1790, 60 ; in 1800, 262 ; in 1810, 401 inhabitants.

I am, Sir, yours, &c.

## LETTER IX.

Montpelier—Fixed upon as the seat of Government—Berlin—Williamstown—  
Brookfield—Randolph—Royalton—Sharon—Hartford.

*Dear Sir,*

TUESDAY, September 30, 1806, we proceeded from Middlesex to Randolph; thirty miles; through Montpelier, Berlin, Williamstown, and Brookfield. The road for the first six miles still continued on Onion river, and was smooth and pleasant. Then turning to the South-East, it ascends a series of gradual acclivities, till it reaches its utmost ascent on these mountains. Thence it proceeds along their sides to the Southern part of Williamstown, over a succession of very easy undulations. Here it descends into Brookfield, about four miles and a half, so rapidly, as to make riding on horseback, throughout a great part of the way unpleasant. The remainder of the distance it lies along one of the head-quarters of White river from its fountain; and is of course sufficiently level. A great part of this road is a turnpike, smooth, and well made.

Montpelier is situated at the confluence of two head waters of Onion river. The intervals on this stream commence at its mouth; and extend, with few interruptions, to this place. The valley is here large enough to contain a village, of perhaps thirty or forty houses, within a reasonable vicinity. The hills, which are high and sudden, approach so near to the river, as to form a defile, rather than an open valley. About thirty or forty buildings; houses, stores, and shops; are already erected here. A few other buildings, and among them a State House, are begun.

The Legislature of Vermont has lately fixed upon this spot, as the permanent seat of government. The determination is obviously unwise; and must have resulted from very limited, or very prejudiced views. It cannot boast even of a central position. But such a position is in this case of no serious importance, and ought scarcely to be regarded. The first object, aimed at in a

measure of this nature, ought to be a large, and if possible a commercial town. In such a place, agreeable accommodations may be furnished to governmental agents. Here will ordinarily be found improved manners, extensive information, and acknowledged respectability. Hither, also, the stream of business will usually run : a circumstance, always convenient to the parties concerned.

By that association of ideas, which is so prominent a characteristic of the human mind, a little town, when the seat of government, will always impart its littleness to the Legislature, and to all its coadjutors. Every thing must here exist on a very limited scale: That conversation, which in the hours of leisure, cannot fail of being resorted to as a relief from the fatigue of business, must be confined, and degrading. All busy men must have their hours of relaxation; and where refined and superiour amusements cannot be obtained, will to a great extent, spend those hours in such as are trifling and contemptible. The character of a town in which a Legislature holds its sessions, will be imparted to its members; and ultimately, to its measures. If this be not good, it will be bad : if it be not honourable, it will be despicable.

Montpelier is now so small, as scarcely to furnish either shelter, or lodging, for the Legislature of this State ; and its situation is such, as to forbid the hope of any future, material enlargement. As Vermont is separated into three distinct parts; the mountains and the countries East and West of them ; and as the mountains can be conveniently passed only through a few clefts ; Windsor and Burlington would undoubtedly be better chosen, as alternate seats of the Government, than any other towns in the State. The inhabitants on one side of the mountains will scarcely be willing to go, always, to the other side : and the mountains themselves can never furnish a proper place for this purpose. These towns must, I think, necessarily become superiour in wealth, and population, to any other. Both of them admit of convenient access : and the character of the inhabitants will be such, as not to detract from the proper respectability of the Government.

The township of Montpelier is extensively settled by farmers. The number of its inhabitants, in 1790, was 118; in 1800, 889; and, in 1810, 1,877.

It ought to have been observed, that the houses along Onion river are sensibly inferior to those, which I have seen in any other part of Vermont, where the cultivation is equally advanced. There are a few exceptions; particularly at Montpelier. On a soil so productive this would not have been expected.

Berlin is a township situated on very high ground, about twenty miles Eastward of the Camel's Back. The surface is a succession of gradual slopes, and open vallies. The soil is good grazing land; and the township is distributed into farms, recently settled. The inhabitants have built a church on an eminence, about half a mile from the road, Westward: an object the more striking, as it was hardly to be expected, in so new a country. Their number, in 1790, was 134; in 1800, 685; and, in 1810, 1,067.

On the road from Berlin to Williamstown, we saw the species of cedar, which I have named *mongrel cedar*.

Williamstown lies on an elevation, little if at all beneath that of Berlin. That part of it, through which we travelled, is however much more pleasant. The settlements were farther advanced; the soil was rich; and the inhabitants, by the appearance of their farms and buildings, were in prosperous circumstances.

From the highest ground on this road there is a most magnificent view over the Connecticut Valley; terminated Eastward by Moosehillock, at the distance of between thirty and forty miles, and North-Eastward at the distance of between sixty and seventy by the White Mountains.

Williamstown is a collection of plantations. In 1790, it contained 146 inhabitants; in 1800, 839; and, in 1810, 1,353.

Brookfield lies on the declension of the same hills; and is generally of the same appearance. The soil on our road was however less fertile; and the face of the country less pleasant. Soon after we entered this township, we came upon one of the head waters of the White river; and, descending very rapidly, came

soon to the foot of the mountains. Here we entered a narrow, flat valley, presenting a succession of verdant intervals, bordering a clear, prattling stream. The hills, by which it was limited, were, however, neither fertile nor pleasant. At Randolph, which we reached a little before sun-set, we found a small village, built along this brook; here swollen into a mill-stream. It contains about thirty buildings; houses, stores, and mechanic's shops; and, what was very welcome to us, a good inn.

The principal part of both these townships lies Westward of the road; and was wholly out of view. The country is a continuation of the same hills, which we passed over in Williamstown. and is generally settled.

In the latter of these townships there is a large quantity of iron ore, which is wrought in several forges, and one slitting mill.

Wednesday, October 1st, we rode to Hartford through Royalton, and Sharon: twenty-seven miles. The road, here, lies uniformly along the banks of White river; and is every where tolerably good, but in some degree encumbered with sand. The valley, except at Royalton, where the Western branches of this river meet that, on which our journey lay, is seldom more than half a mile in breadth, and often less. The hills on both sides have little to recommend them, either to the farmer, the poet, or the painter. The river is always sprightly, and handsome; and at Royalton is a stream of considerable size. Its waters, like those of the Saco, and the Hoosac, are remarkably pure, gay, and murmuring. The intervals on its borders are narrow, but frequently rich and beautiful; and the houses are generally good. All the characteristics of a recent settlement have vanished from this ground.

I found this day's journey less pleasant than I had expected. The valley was narrow. The hills were neither grand, fertile, nor beautiful. We were shut up from the world; and the eye had scarcely an opportunity to wander beyond the unpleasant barriers, which on both sides accompanied it through the day. We were wearied with sameness, oppressed by heat, and almost suffocated by dust. To balance these disagreeable circumstan-

ces, the intervals were generally handsome; the river always cheerful; and the houses usually neat, with pretty appendages; awakening every where the conviction, that the inhabitants were in possession of ease and comfort, and generally of thrift and prosperity.

The village of Royalton was peculiarly of this nature. It consists of about thirty houses, surrounding a well-built academy. Few objects are more cheerful than this little cluster. Just before we arrived at it, we were presented, also, with a beautiful expansion, formed by the junction of two branches of White river.

Sharon is an exception, of the contrary kind: the soil, the houses, and the prospects, being all indifferent.

In the township of Hartford a village has started up within three or four years, in the neighbourhood of several mills, erected at the distance of three miles from the mouth of White river. It is of about the same size with that of Royalton, but less beautiful. A great quantity of lumber, sawn at this place, is conveyed in rafts down the Connecticut. A good bridge has been lately erected, here, on White river.

This stream has five considerable head waters; one of which rises in the township of Philadelphia, another in that of Kingston, a third in Roxbury, a fourth in Williamstown, and a fifth in Washington. Its course from Kingston is about fifty miles. It is, every where, murmuring, cheerful, and pure.

The farmers in all these townships live principally on the hills; the summits of which are fertile. Merchants and mechanics plant themselves in the vallies; and usually acquire ease and competence.

Brookfield contained in 1790, 421; in 1800, 988; in 1810, 1,384 inhabitants. Randolph contained in 1790, 892; in 1800, 1,841; in 1810, 2,255 inhabitants. Royalton contained in 1790, 748; in 1800, 1,488; in 1810, 1,768 inhabitants. Sharon contained in 1790, 569; in 1800, 1,170; in 1810, 1,363 inhabitants. Hartford contained in 1790, 988; in 1800, 1,495; in 1810, 1,831 inhabitants.

We lodged at an inn on the South side of the bridge; and the next day, pursuing our journey down Connecticut river, arrived at New-Haven on Monday, Oct. 6th. I am, Sir, yours, &c.

## LETTER X.

New-Haven Falls—Panton—Addison—Forests—Hickory—Equivocal generation of Plants—Major-General Strong—Rev. Dr. Swift.

*Dear Sir,*

I WILL now return from this description of the interior of Vermont, to Vergennes, and to the 1st of October, 1798.

Mr. L—— and myself went, with several gentlemen, to examine the falls, commonly known by the name of New-Haven Falls, because they lie in that part of Vergennes, which was originally taken from this township. The river, here very deep, descends over a ledge of lime-stone, forty-one feet in height. The precipice is bold and rough; and exhibits falling water in every form of grandeur, and in very many of wild, fantastical beauty. A numerous train of mills, forges, and other water works, are already erected at this place; and are said to yield a very handsome profit to the proprietors.

In the afternoon, we rode to Addison; fourteen miles; the three first, the worst road, which I ever saw. The remainder was tolerably good. Of the country I can say little; having passed most of it in the evening.

Panton, the township immediately South of Vergennes, is a very recent settlement; of which the inhabitants are principally Baptists, said to sustain a good character. In 1790, it contained 220 inhabitants; in 1800, 363; and, in 1810, 520.

Addison, like Panton, is a flat country, along the lake; but in the interior is undulating, and in one place mountainous. The soil is principally clay; and in the Eastern and Northern parts, is rich. The South-Western quarter is lean.

The lands, which have here been once cultivated, and again permitted to lie waste for several years, yield a rich and fine growth of hickory. Of this wood there is not, I believe, a single tree in any original forest within fifty miles from this spot. The native growth is here white pine; of which I did not see a single

stem amid a whole grove of hickory. Similar specimens of an entire change in the forest vegetation are common in many, perhaps in all, parts of New-England, where the land has been cultivated, and again covered with wood. This change is commonly attributed by unthinking, as it has often been by thinking, men to equivocal generation: the material elements being supposed to possess a chemical power of originating, and perfecting, vegetation, without the aid of seeds. To support the supposition, however, philosophy, although she has frequently adopted it, has never been able to find a single fact, or allege a particle of positive evidence. The opinion obviously contradicts all known analogy; and is sustained only by that broken reed, *inexplicableness*.

The seeds of vegetables, when lodged beneath that thin stratum of earth, within which they germinate, have no apparent tendency to decay; but continue to possess all their vegetative power through an indefinite number of centuries. When the existing forest is cut down, and its seeds are destroyed by cultivation, those, which were shed by a more ancient growth, being thrown up by the plough within the limits of this stratum, spring in their turn; and cover the surface with trees of a new kind. The following facts will throw some light on this subject.

A field, about five miles from Northampton on an eminence, called Rail Hill, was cultivated about a century ago. The native growth here, and in all the surrounding region, was wholly oak, chesnut, &c. As the field belonged to my grandfather; I had the best opportunity of learning its history. It contained about five acres, in the form of an irregular parallelogram. As the savages rendered the cultivation dangerous; it was given up. On this ground there sprang up a grove of white pines, covering the field, and retaining its figure exactly. So far as I remember, there was not in it a single oak or chesnut tree. Pines were as thick, as they could conveniently grow; and when I first saw them, about the year 1760, had attained a considerable size. When I last saw them, more than twenty years afterwards, they were large trees; yet there was not a single pine, whose seeds

were, or, probably, had for ages been, sufficiently near to have been planted on the spot. The facts; that these white pines covered this field exactly, so as to preserve both its extent and figure; and that there were none in the neighbourhood; are decisive proofs, that cultivation brought up the seeds of a former forest within the limits of vegetation, and gave them an opportunity to germinate. The regularity, and limits, of the process are entirely inconsistent with the doctrine of equivocal generation.

A respectable farmer in Guilford informed me, some years since, that thirty years before the event, to which I principally refer in this paragraph, took place, his father, while reaping a field of wheat, found a quantity of chess; which he directed his labourers to reap also, and bind in bundles, to be carried home for fodder. On the day, when the wheat was carried home, it was inconvenient to carry the chess: it was, therefore, thrown together upon a bawk, or head-land. The following night it was drenched with rain; and was finally left to rot upon the place. Thirty years after this fact, the field having come by his father's death into the possession of my informant, it became necessary to make a new fence between that, and another bordering upon it; but as a considerable number of bushes had grown up upon the headlands, on both sides; he concluded to remove the fence, and break up these headlands. The ground was accordingly cleared, and ploughed: and on the spot, where the chess had been thrown, there sprang up a new crop of chess, as evenly spread, as if it had been sown by a skillful hand.

The Hon. Judge Reeve of Litchfield, told me some years ago, that a farmer of his acquaintance, having sown turnips, and suffered some of them to remain on a field, they produced seed, the following year, which was scattered on the ground. For twenty-five years afterwards; i. e. to the time, when the fact was mentioned to me; whenever this field was ploughed, turnips in considerable numbers sprang up in this spot.

Mr. Parker, an English gentleman from Yorkshire, who came, some years since, to the United States, as the Agent from the merchants of England to the Government of this country, inform-

ed me, that a tract of marshy ground on the Eastern coast of England had, some years before, been purchased by several gentlemen, and drained. On the earth, which was thrown out of the ditches, cut through it, there sprang up a great quantity of white mustard. As this plant had not been known to grow any where in the vicinity, within the remembrance of any living man; its appearance excited much curiosity. After many schemes to account for it, had been proposed, and rejected, it was found, that, two hundred years before, white mustard had been extensively cultivated on the same spot, by a colony of Dutch settlers.

I could easily add other instances to these; a number of which have fallen under my own observation; but it must be unnecessary. If seeds will continue possessed of vegetative life for twenty years, they may, unquestionably, continue possessed of it two hundred, two thousand, or twenty thousand. There can, therefore, be no difficulty in assigning the cause of any phenomenon, like that, which gave birth to this discussion.

I will conclude these observations by mentioning a remarkable fact, communicated to me by the Hon. Judge Chipman of Vermont. This gentleman told me, while I was at Rutland on this journey, that, when he resided at Kingston in the county of Addison, there customarily sprung up in the cultivated fields, on his estate, an immense multitude of cherry-trees, of a peculiar species. The original forest was here composed of beech, maple, hemlock, &c. and appeared as ancient, as any American forest whatever. It was perfectly destitute of these cherry-trees. As he was walking in a field, newly broken up, and recently ploughed, he observed the infant stems of these cherry-trees, sprung up in very great numbers. His workmen, who believed in the doctrine of equivocal generation, triumphantly asked him, whence he supposed these trees to proceed. Without answering the question, he forced his hand a little distance into the earth; and drew up a handful of cherry-stones.

We lodged in Addison, at the house of Major General Strong.

This gentleman, originally and inhabitant of Salisbury in Connecticut, planted himself here before the Revolutionary war.

During the early periods of his residence in this township availing himself of the market, furnished by the British garrison at Crown Point, and the high prices which they gave for every thing, supplied by his plantation, he became possessed of very handsome property. In that war, he experienced a painful reverse of fortune. His house was burnt ; his cattle were carried off ; and his furniture was plundered, by the British. Once he was made a prisoner by the Indians in their service : and both himself, and his family, were shamefully abused. When he had regained his liberty, he retired to Arlington ; where he took a farm upon lease, and cultivated it until the year 1783. After the peace he returned again to Addison ; and by various business, industriously and prudently pursued, has raised himself to affluence.

The Rev. Doctor Swift, for some time the pastor of Bennington, spent the last years of his life in Addison. Here he lived in the utmost harmony with his parishioners until his death, in 1804.

Many of them will probably remember him with gratitude throughout eternity. Doctor Swift was one of the best, and most useful, men, whom I ever knew. He possessed an understanding naturally vigorous, respectable learning, sound theological opinions, eminent prudence, and distinguished zeal, combined in the happiest manner with moderation, benevolence, and piety. Good men loved him and delighted in his society ; and the worst men acknowledged his worth. To the churches, and Ministers, of Vermont, he was a patriarch : and wherever he was known he is remembered with the highest veneration.

I am, Sir, yours, &c.

## LETTER XI.

Crown-Point Fortress—Conduct of the French Government towards the Colonists of the United States, and reflections on its character.

*Dear Sir,*

TUESDAY, October 2nd, we left Addison early in the morning, and rode to Chimney Point: a mile and a half up the lake. Here we crossed the ferry, half a mile in breadth; and landed at Crown Point. A boy fourteen years old managed the boat. We found nothing in the ferry-house, except naked, half-ruined walls, scraps of furniture, and other melancholy proofs of shiftless poverty.

We landed at a redoubt on the South-Eastern point of the peninsula, intended to look up the lake, or towards Skeenesborough.\* This work was never completed. The wall is of earth, high, and very little decayed; and the trench, so far as it was finished, is in good preservation. From this place we proceeded to the fort, erected here by the British, soon after the termination of the Canadian war. This fortress is irregular in its form; but is perhaps as near an exact square, as the ground would permit. The walls are sixteen feet high; twenty feet thick; surrounded by a trench; and confidently said to be a mile in circumference. In various places they are decayed. The trench is partly filled up. The bomb-proof, which was extensive, and the covered way, a subterranean passage, thirty rods in length, leading to the North shore, are both partly fallen in. There are three barracks in this work, originally handsome, but now in ruins.

This fort, and its garrison, are said upon good authority to have cost the British two millions of pounds sterling. The stone of which it was built, was all blown out of a quarry in the neighbourhood: and the earth is said to have been brought on shovels by hand. In a very partial degree this may have been true; but even in this degree is hardly credible. That the expense and labour were very great, will not be doubted by any spectator.

\* Now Whitehall.

These works were valuable, only, as they controuled the passage up and down lake Champlain. The spot is too flat to be defensible; and is perfectly commanded by the neighbouring hills on the West. No human labour, not even the Egyptian pyramids, have been more absolutely useless. From their first erection to the present hour they have never been occupied during a single moment, either in offensive or defensive operations.

From the highest part of this fortification, the Green Mountains present a prospect of grandeur: superiour, I think, to any other. The mountains on the West are seen also with great advantage; but with less than that at Vergennes, Burlington, or the mountains East of Middlebury. The same spot commands a noble view of the lake, opening to the North with an expanse scarcely limitable to the eye.

From the British works we proceeded to the French fort; erected in 1731 on the North-Eastern extremity of the peninsula. These fortifications were of small extent; of no great strength; overlooked by the ground in the neighbourhood; and entirely indefensible. They were, however, well fitted for their design.

Permit me to detail to you, exactly, the thoughts which occurred to me on this spot. At the time, when the American Colonies were settled, it was a well known, and universally acknowledged, law of nations, that the discovery of lands in the new world gave an indefeasible title to the nation, under whose authority the discoverer sailed. Of this law the French availed themselves; whenever it suited their interests; and, according to their general principles, violated it only when their convenience prompted. Although they had not a shadow of a title to their own possessions in America, beside what was founded on this law, yet for more than a century they pursued without intermission, a regular design of exterminating the British Colonists. The lands, which the latter with incalculable labour, expense, and hazard, had converted into a comfortable residence, the former struggled for more than one hundred and thirty years to wrest from them by every effort of force, fraud, and cruelty. In pursu-

ance of this plan they early passed their own boundaries ; and began to build a chain of forts from Canada to the mouth of the Mississippi. Of these fortresses a great part were erected within the acknowledged limits of the British territories. A French fort is always preceded, or followed by a French claim ; and is intended regularly to substantiate that claim against the demands of others.\* The memorable moral reason so often urged during the late Revolution by the French government, and its agents, as a vindication of prostituted faith, and unprincipled intrusion ; “ That it was convenient for France ; ” was towards the British Colonies their only rule of action. In conformity to it they boldly advanced into the Province of New-York ; and erected these works, and those at Ticonderoga, seventy, and ninety, miles without their own boundaries ; at Niagara in the same Colony ; at the forks of the Ohio, in Pennsylvania ; and at various other places. By this chain of fortresses they intended to confine the British settlers within limits more and more narrow and by raising up a numerous population in the vast regions of the interior to reduce them, ultimately, under their own power, or drive them into the ocean. Canada and Louisiana ; a fiftieth part of which they were unable to settle, were in their view nothing, so long as there were other regions, the acquisition of which might gratify their ever restless ambition, and gaping avarice.

In pursuance of this object they adopted a system of measures perfectly suited to its nature. By that insinuation, and intrigue, for which they have ever been proverbially distinguished, they wheedled the Savages into their designs.† The English Colo-

\* “ New-France, as the French now claim extends from the mouth of the river St. Lawrence : by which the French plainly show their intention of enclosing the British settlements. The English in America have too good reason to apprehend such a design when they see the French King’s Geographer, publish a map, by which he has set bounds to the British Empire in America, and has taken in many of the English settlements, both in South-Carolina and New-York, within the boundaries of New-France.—*Colden, Vol. 1. p. 239.* ”

† “ We have found by more than three score years experience, that we had always lived in perfect peace with our neighbouring Indians, had it not been for the instigation, protection, supply, and even personal assistance of the French ; so that in case

nists, they persuaded them, were enemies, combined for their destruction; heretical miscreants, whose extermination was sanctioned, and demanded, by religion itself. The French, in the mean time, they were taught to consider as their most affectionate friends; deeply interested in their welfare, and anxiously engaged to vindicate their rights. Equally were they instructed to regard them as the only genuine supporters of Christianity; nobly engaged to uphold its cause against the enemies of God. The former part of this lesson a Savage could easily learn by heart; and, although he understood very little of the latter, yet he readily believed a Heretic to be a bad man; to kill whom was not only lawful, but meritorious.\* With these preparations they excited the Indians to perpetual hostilities against the English Colonists; and stimulated them to burn their houses, to butcher women, and to murder alike the man of grey hairs and the infant in the cradle. To the work of blood, and ruin, they daily quickened them by bidding a price for every scalp, which they should

any unjust war or breach should happen (which God forbid) we shall look upon the French, and principally the popish Missionaries among them as the main cause thereof."—*Governour Shutes' letter to Rolle the Jesuit, Feb. 21st, 1719. Mass. Hist. Col. Vol. 6.*

"The French sent some of their wisest Priests and Jesuits to reside among them; and the Governors of New-York were ordered by the Duke of York to give these Priests all the encouragement in their power. The chief view of these priests was to give the Indians the highest opinion of the French power and wisdom, and to render the English as suspected, and as mean as possible in their eyes. They waited likewise for every opportunity to breed a quarrel between the English and the Indians; and to withdraw the Five Nations from fighting with those nations that traded to Canada.—*Colden's History of the Five Nations, Part 1. Ch. 3.—See also page 59 and 60.*

\* A strong specimen of the Christianity taught to the Indians by the Romish priests, and of their own views of religion, is given by Lieutenant Governour Colden in his history of the Five Indian Nations, Vol. 1 p. 207.

"About the time of the conclusion of the peace of Ryswick the noted Therouet (an Indian Sachem) died at Montreal. The French gave him Christian burial in a pompous manner: the priest that attended him at his death having declared that he died a true Christian, "For," said the priest, "while I explained to him the passion of our Saviour whom the Jews crucified, he cried out, "Oh! had I been there I would have revenged his death and brought away their scalps."

bring ; and, with plentiful supplies of food, and strong drink, feasted the spirit of slaughter.

In the secret chambers of this very fort, dug, as became such designs, beneath the ground, copies of the vaults of abbies and castles, in their native country ; caverns, to which treachery and murder slunk from the eye of day ; those plots were contrived, which were to terminate in the destruction of families, and villages, throughout New-York and New-England. By the inhabitants of these countries, the wretches, who contrived them, had never been injured, even in thought. Peaceable in their lives, and satisfied with the produce of their own honest industry, they asked nothing more than to eat their bread in quiet, and to enjoy without intrusion the blessings, given them by their Creator. Here the price was fixed, which was to be paid for the scalps of these unoffending people. Here the scout was formed ; the path of murder marked out ; the future butchery realized in anticipation ; and the captive tortured in prescience, before the day of his actual doom. Here cruelty presided at the Council, and in cold blood feasted on the shrieks, the groans, the gasps, and the agonies of suffering parents, and their slaughtered offspring. Here butchery with a smile organized the system of death, and conflagration ; and with snaky windings led the human wolf through paths, which himself was unable to devise, and to barbarities, of which he had never before formed a conception. Here was kindled the fire, which ere long blazed to heaven ; and consumed the houses, the happiness, and the hopes, of thousands, fairly numbered among the best inhabitants on the globe. Here, worst of all, were displayed long rows of scalps ; white in one place with the venerable locks of age, and glistening in another with the ringlets of childhood and of youth ; received and surveyed with smiles of self-gratulation, and rewarded with the promised and ungrudged boon.

Such were some of the thoughts, which instinctively crowded into my mind at the sight of the subterranean chambers, which are now the ruins of this infamous fortress.

Crown Point, notwithstanding the fine prospects which I have mentioned, is a gloomy, melancholy spot. The houses are almost mere hovels : and the few, beggared inhabitants appear like outcasts from human society. Rags and tattered garments, washed and hung out to dry, strongly indicated their miserable circumstances. Not a cheerful object, beside the Northern prospect of the lake, and a little verdure thinly dispersed, met the eye. A great part of the surface was overspread by ruined fortresses : the relics of war and destruction, and the monuments of perfidy, ambition, and cruelty. The opposite shore is to the eye wild and dreary. A forest, consisting in a great measure of pines, burnt and blasted, spread beyond the sight. A decayed and dismal house on Chimney Point was the only human habitation in view upon that shore. Beyond the forest rose the Green Mountains in lofty piles of grandeur ; inspiring emotions remote from cheerfulness, and in such a scene harmonizing only with melancholy solemnity. On the West, a chain of hills, unusually ragged and inhospitable, ascends immediately from the lake ; forbidding, except in now and then a solitary spot, the settlement of man. From their wild and shaggy recesses the traveller is warned to expect the approach of the wolf and the bear : and from their rugged cliffs, projecting to the water's edge, the boatman is taught to look for shipwreck and destruction.

The property of this peninsula is in Columbia College. Whether the pecuniary profits of the Point will ever reach the College, I doubt : and it also appears doubtful whether the literature of the College will ever reach the Point.

I am, Sir, yours, &c.

## LETTER XII.

Lake Champlain—Healthfulness of its borders—Trade—Bridport—Shoreham—  
Cornwall—Orwell—Benson—West-Haven—Fair-Haven.

*Dear Sir,*

BETWEEN ten and eleven we returned to Chimney Point ; and, taking our horses, rode to Shoreham, where we dined. The country along the lake, beginning a little South of General Strong's house, and extending through Bridport, wears the same disagreeable aspect. The ground is hard clay, glistening in the track of the horse and the wheel; the surface flat and lifeless; the forest chiefly pine; and so often burnt, that a great part of the trees are either decayed, or dead. The inhabitants are universally poor; and their houses generally log-huts. What inducements any man could find to plant himself on this ground, it is not easy for me to determine. The climate is sickly; the soil indifferent; the water bad; and the scenery dull and heavy. At the same time, I could not discern the remotest hope of any change for the better.

Among other disagreeable objects in this region, the streams are remarkable. Their appearance is singular. The beds, in which they flow, are excessively disproportioned in breadth to the quantity of water; appearing rather as shallow, flat vallies, than as the channels of brooks and mill streams. One of them I judged to be not less than sixty rods in breadth; in the middle of which ran, or rather lay, a mass of water, scarcely sufficient to turn an over-shot mill. In the summer, and autumn, they are covered with bulrushes and other rank weeds: while the pool at the bottom, turbid with clay, resembles in colour dirty suds. In passing these receptacles we were saluted by a sweet, sickish effluvia, oppressive to the lungs, and extremely dispiriting to the feelings. In the winter, and spring, the streams fill these beds; and demand very long and expensive bridges; seriously inconvenient, as one would suppose, to the inhabitants. To complete

the dulness of this region, the post road, which formerly passed along the lake, now turns from Shoreham into the interior. The travelling therefore, has chiefly left this tract: and a stranger has become almost a curiosity.

As I am now leaving lake Champlain, I will dismiss it with a few observations. This piece of water extends from Fair-Haven to St. John's in Canada: two hundred miles. Its least breadth is half a mile; and its greatest eighteen miles. Its contents are estimated by Doctor Williams at 640,000 acres. This is probably very near the truth. From Fair-Haven to Crown Point it is narrow, and in some places shallow; but of sufficient depth for any vessel, which will ever be needed here. In this division the waters are of the same disagreeable colour, which has been mentioned. The shore, where I had opportunity to observe it, is lined with a margin of bulrushes, and the same sickly fetor is found here also. No piece of water can easily be more unpleasant than this part of lake Champlain.

At Crown Point its aspect changes in an instant. The depth becomes great; the water loses its foul appearance; is pleasant to the eye, and, as I am informed, is sweet and salubrious. Here, also, it extends suddenly to the breadth of four or five miles; and assumes an aspect of magnificence. Against Ferrisburgh it expands suddenly again to the breadth of ten or twelve miles; and continues to grow wider as far as Burlington. After this it holds its breadth, generally, until near the forty-fifth degree of latitude. Its depth from Crown Point Northward is great: but I know not, that it has been accurately measured. The principal islands in its bosom have been mentioned above.

The waters of lake Champlain are supposed by the inhabitants to have been formerly much higher than at present. This opinion is probably just; and may, I suspect, be applied to every such piece of water, whose outlet does not flow over level ground, or is not confined by a mound of granite, or some other stone of similar hardness.

The fish in this lake are not, I believe, very numerous. A species of salmon,\* as it is called, is caught here ; but is neither fat, nor finely flavoured, nor possessed of much resemblance to the salmon of the New-England rivers. The pike and salmon-trout are also taken here : both of them said to be large, and well tasted.

The shores of lake Champlain are generally subject to the fever and ague, and to bilious remittents. We found the inhabitants sick in considerable numbers with the latter disease, and with the dysentery. This sickliness principally prevails along the Southern division. In the Northern division the country is fine ; the climate better ; the lake noble ; and the scenery in a high degree magnificent.

About thirty vessels, from thirty to seventy tons, were said to be employed on this lake in the year 1800 ; i. e. in plying from Skeenesborough to St. John's. The business is increasing. The foreign commodities, consumed in this part of Vermont, are brought chiefly from Troy, Albany, and New-York. Furs and peltry are procured in large quantities at Montreal, and a few European and India goods. The former are transmitted chiefly to Boston. The trade in the latter has, within a small number of years from the present time, (1811) been greatly increased. Whenever Montreal shall become a seat of general importation, the commerce of this lake will probably extensively centre in that city.

The township of Crown Point, of which the peninsula is an appendage, and to which it has given its name of Crown Point, covers a considerable tract.

Shoreham rises into gradual swells. The forests have been less burned ; the soil, still clay, is richer ; the houses are superior ; and the inhabitants are, in all respects, better situated. You will understand me to speak of the appearance on the road ; the interior of Bridport, as well as of Addison, being, as I was informed, a desirable country.

\* But the salmon and other fish are said greatly to have multiplied in this lake within a few years. 1814.

Here we parted with our friend Col. S——, who had politely accompanied us forty-eight miles of our journey, and contributed not a little to the stock of our information and pleasure. We rode the same evening to West-Haven; having travelled thirty-two miles. Our journey lay through the remainder of Shoreham, Orwell, and Benson. The two last of these townships we found rough and unsightly; the soil clay, of a good quality. In the year 1806 I had a better opportunity of examining these three townships. As I remarked at the commencement of these letters, the Taghkannuc range passes through West-Haven, and Benson. It is here a collection of hills, divested of grandeur, and destitute of beauty. The surface is every where broken; studded at little distances with tubercles, formed by masses of rocks and smaller stones, swelling suddenly out of their sides and summits. The vallies, also, approximate to the appearance of ravines; and are sudden, deep, and uncouth. The brooks run in huge furrows, and deep gullies: and the whole country exhibits an aspect, singularly corrugated. We saw, however, one handsome farm in the Northern part of West-Haven; and the Western borders of that township are said to be fertile and beautiful.

In Benson a respectable clergyman had been settled eight or ten years. Sometime before we passed through this town, a great part of his parishoners, influenced by the prevailing turbulence of the times, and by the vice which necessarily grows out of that turbulence, became to such a degree alienated from him in their affections, as to make him, not unfrequently, an object of diversion and insult. A man of sense, learning, and piety; of superior prudence and unexceptionable life, such as he is, could not be made ridiculous: yet he could be ridiculed. The heart could disrelish his excellence, although the conscience was compelled to approve of his character. The young people, particularly, became grossly hostile to him, merely because he was a Minister of the Gospel, and a virtuous man. To such a pitch did this unworthy and licentious conduct rise, that the clergyman was giving up his cure as hopeless, and preparing to take a final leave of the Congregation. At this moment, He, who has graven his church on the

palms of his hands, produced in this waste a general revival of religion. The "still, small voice," which has so often hushed the storm and the whirlwind, was no sooner heard, than the people dropped their animosity against their minister; vice and licentiousness fled; peace, order, and good-will, took their place. This worthy man became at once endeared to his flock; the church was enlarged by the accession of multitudes; and all the blessings of christian neighbourhood sprang up in the place of tumult and confusion. The thought of so happy a change smoothed all the ruggedness of this untoward country, to my eye, into elegance and beauty; and enabled me to realize what it is for the wilderness and solitary place to be glad, and the desert to rejoice and blossom as the rose.

The Southern part of Orwell is distinguished from Benson by nothing, but a general softening of the ruggedness of the country. The Northern part is a handsome tract. The soil is rich; and the appearance of the farms, and houses, sufficiently indicates the prosperity of the inhabitants. The country, here, has the aspect of a mature settlement.

In this journey we passed through Cornwall; a township of uncommon beauty and prosperity, lying North-Eastward of Orwell. It is a fine assemblage of hills and vallies, elegantly arched, and vigorously productive. The landscape is every where pleasing and at the Eastern and Western limits uncommonly majestic: the two great ranges, which I have frequently mentioned, being visible here to a great extent, and with high advantage. The inhabitants are distinguished for their morals and their piety.

Addison contained in 1790, 401; in 1800, 734; in 1810, 1,100 inhabitants. Crown Point contained in 1790, 203; in 1800, 941; in 1810, 1,082 inhabitants. Bridport contained in 1790, 449; in 1800, 1,124; in 1810, 1,520 inhabitants. Shoreham contained in 1790, 721; in 1800, 1,447; in 1810, 2,033 inhabitants. Cornwall contained in 1790, 826; in 1800, 1,163; in 1810, 1,279 inhabitants. Orwell contained in 1790, 778; in 1800, 1,386; in 1810, 1,849 inhabitants. Benson contained in 1790, 658; in 1800, 1,164; in 1810, 1,561 inhabitants. West-Haven contained in 1800, 340; in 1810, 679 inhabitants.

Wednesday, October 3d, we left West-Haven, and rode through Fair-Haven and then entering the State of New-York, passed through Hampton, Granville, Westfield, and Kingsbury, to Sandy-Hill : thirty-eight miles. Most of the road was tolerably good.

Fair-Haven is, generally, a rough, disagreeable township. The only exception to this remark, within our view, was on its southern limit along Pulteney river ; where there is a small tract of handsome intervals. The hills, particularly one near the river, are remarkably ragged. The soil, also, along the road is sandy and indifferent. The only cheerful object, which met our view before we reached the river, was a collection of very busy mills, and other water-works.

Fair-Haven, in 1790, included West-Haven ; and contained 545 inhabitants ; in 1800, there were in Fair-Haven 411 ; and, in 1810, 645. Both of these townships are small.

I am, Sir, yours, &c.

## LETTER XIII.

Account of the State of Vermont—Mode of forming new settlements—Character of the Settlers.

*Dear Sir,*

As I am now bidding adieu to Vermont, it will be proper to give you a general view of this State.

The State of Vermont is the North-West corner of New-England; and is bounded on the North by Canada, on the East by New-Hampshire, on the South by Massachusetts, and on the West by New-York, which also forms a little part of its Southern boundary. Connecticut river washes the whole Eastern limit; and Lake Champlain the principal part of the Western. Its length in a direct line is about one hundred and fifty-seven miles; its breadth, at the Northern boundary, ninety; and at the Southern, forty-one: furnishing an area of about 10,240 square miles; or about 6,555,000 acres. It lies between  $42^{\circ} 44'$  and  $45^{\circ}$  North Latitude; and between  $1^{\circ} 43'$  and  $3^{\circ} 36'$  East Longitude, from Philadelphia: or between  $71^{\circ} 32'$  and  $73^{\circ} 25'$  West from London.

The surface of this State, as has been already observed, is customarily divided into three parts; the mountains in the middle, and the lower grounds on each side. The area, occupied by these divisions, is not far from being equal. When an European hears mountains mentioned, I presume he naturally associates with the word a collection of naked rocks, partially covered with unproductive earth, sterile, dreary, and desolate. Throughout New-England, and indeed throughout a great part of the United States, the mountains are covered to their summits with a rich soil, and with thick, and, except at great heights, with very thrifty, forests. The Green Mountains, particularly, are a fertile tract of country; and with the exception of a few lofty summits, and here and there a rugged spot on their declivities, are every where laid out in townships; and are filled, or will soon be filled, with inhabitants. A Swiss gentleman, who not long since visited

the United States, preferred a township on these mountains to any other spot, which he had seen in America. These high grounds are, however, better fitted for grazing than for agriculture.

The country on each side consists of hills, vallies, and plains. The hills are often of considerable height; and several of them are mountainous. The plains are of moderate extent: the surface being almost every where variant, and undulating. The soil of both these divisions is generally rich; and yields liberally the various productions of the climate. Apples and pears grow well, in the Western division, to the Northern line of the State. In the Eastern division, at least on Connecticut river, we did not find them so prosperous in the same latitude. I am apprehensive however, that this was the result of accidental circumstances. Currants, gooseberries, and other kinds of shrub fruit, will grow easily here; together with very fine strawberries. Peaches grow as high as Middlebury and Newbury, if I was not misinformed; but can hardly be said to flourish, beyond the Northern boundary of Massachusetts.

This State is extremely well watered by small rivers, brooks, and springs. Almost every farm has its rivulet; and every town its mill-stream. In the Western division the water is, generally, less fitted for culinary purposes than that in the other two; being impregnated either with lime, or clay. Horses, coming from the other States in New-England, drink it with some reluctance. I know not, that it has been found injurious to health. The water in the other divisions is excellent.

From this account it will be seen, that Vermont will naturally become a manufacturing country. Wool, flax, hemp, and iron, are the produce of its own grounds: and cotton its inhabitants can easily procure in any quantities. Streams, and mill-seats, fitted for every kind of machinery, of which water is the moving principle, abound every where; and the inhabitants are sufficiently ingenious to form, and manage successfully, every engine of this nature.

The markets, to which the people of this state resort for the purposes of trade are Quebec, Montreal, Troy, Albany, New-York, Hartford, Boston, and Portland. To Quebec they send large quantities of lumber by lake Champlain, and its outlet, the river Sorell. With Montreal they trade for furs, peltry, and some foreign commodities. This business has been lately very much increased. On the Western side of the mountains they derive most foreign goods from Troy, Albany, and New-York. Fatted cattle they drive to New-York, Boston, and sometimes, if I mistake not, to Philadelphia. Horses they sell at New-Haven and Hartford for the West-Indian market. On Connecticut river, lumber and other produce is transported to Hartford; and foreign commodities of various kinds are taken in return. Most parts of the State, also, carry on a considerable trade with Boston. From the Counties of Orange, Caledonia, and Essex, they resort to Portland; and from that of Essex, they must, I think, in the end find a profitable market for their cattle at Quebec, and for some kinds of produce at Hallowell in the District of Maine.

Vermont has been settled entirely from the other States of New-England. The inhabitants have, of course, the New-England character, with no other difference beside what is accidental. In the formation of Colonies, those, who are first inclined to emigrate, are usually such, as have met with difficulties at home. These are commonly joined by persons, who, having large families, and small farms, are induced, for the sake of settling their children comfortably, to seek for new and cheaper lands. To both are always added the discontented, the enterprising, the ambitious, and the covetous. Many, of the first, and some, of all these classes, are found in every new American country, within ten years after its settlement has commenced. From this period, kindred, friendship, and former neighbourhood, prompt others to follow them. Others, still, are allured by the prospect of gain, presented in every new country to the sagacious, from the purchase and sale of lands: while not a small number are influenced by the brilliant stories, which every where are told concerning most tracts during the early progress of their set-

tlement. A considerable part of all those, who *begin* the cultivation of the wilderness, may be denominated *foresters*, or *Pioneers*. The business of these persons is no other than to cut down trees, build log-houses, lay open forested grounds to cultivation, and prepare the way for those who come after them. These men cannot live in regular society. They are too idle; too talkative; too passionate; too prodigal; and too shiftless; to acquire either property or character. They are impatient of the restraints of law, religion, and morality; grumble about the taxes, by which Rulers, Ministers, and School-masters, are supported; and complain incessantly, as well as bitterly, of the extortions of mechanics, farmers, merchants, and physicians; to whom they are always indebted. At the same time, they are usually possessed, in their own view, of uncommon wisdom; understand medical science, politics, and religion, better than those, who have studied them through life; and, although they manage their own concerns worse than any other men, feel perfectly satisfied, that they could manage those of the nation far better than the agents, to whom they are committed by the public. After displaying their own talents, and worth; after censuring the weakness, and wickedness, of their superiours; after exposing the injustice of the community in neglecting to invest persons of such merit with public offices; in many an eloquent harangue, uttered by many a kitchen fire, in every blacksmith's shop, and in every corner of the streets; and finding all their efforts vain; they become at length discouraged: and under the pressure of poverty, the fear of a gaol, and the consciousness of public contempt, leave their native places, and betake themselves to the wilderness.

Here they are obliged either to work, or starve. They accordingly cut down some trees, and girdle others; they furnish themselves with an ill-built log-house, and a worse barn; and reduce a part of the forest into fields, half-enclosed, and half-cultivated. The forests furnish browse; and their fields yield a stinted herbage. On this scanty provision they feed a few cattle: and with these, and the penurious products of their labour, eked out by hunting and fishing, they keep their families alive.

A farm, thus far cleared, promises immediate subsistence to a better husbandman. A log-house, thus built, presents, when repaired with moderate exertions, a shelter for his family. Such a husbandman is therefore induced by these little advantages, where the soil and situation please him, to purchase such a farm; when he would not plant himself in an absolute wilderness. The proprietor is always ready to sell: for he loves this irregular, adventurous, half-working, and half-lounging life; and hates the sober industry, and prudent economy, by which his bush pasture might be changed into a farm, and himself raised to thrift and independence. The bargain is soon made. The forester, receiving more money for his improvements than he ever before possessed, and a price for the soil, somewhat enhanced by surrounding settlements, willingly quits his house, to build another like it, and his farm, to girdle trees, hunt, and saunter, in another place. His wife accompanies him only from a sense of duty, or necessity; and secretly pines for the quiet, orderly, friendly society, to which she originally bade a reluctant farewell. Her husband, in the mean time, becomes less and less a civilized man: and almost every thing in the family, which is amiable and meritorious, is usually the result of her principles, care, and influence.

The second proprietor is commonly a *farmer*; and with an industry and spirit, deserving no small commendation, changes the desert into a fruitful field.

This change is accomplished much more rapidly in some places than in others; as various causes, often accidental, operate. In some instances a settlement is begun by farmers; and assumes the aspect of regular society from its commencement. This, to some extent, is always the fact: and the greater number of the first planters are, probably, of this description: but some of them also, are foresters; and sometimes a majority.

You must have remarked a very sensible difference in the character of different towns, through which I have passed. This diversity is in no small degree derived from the original character of the planters, in the different cases.

The class of men, who have been the principal subject of these remarks, have already straggled onward from New-England, as well as from other parts of the Union, to Louisiana. In a political view, their emigration is of very serious utility to the ancient settlements. All countries contain restless inhabitants; men impatient of labour; men, who will contract debts without intending to pay them; who had rather talk than work; whose vanity persuades them, that they are wise, and prevents them from knowing, that they are fools; who are delighted with innovation; who think places of power and profit due to their peculiar merits; who feel, that every change from good order and established society will be beneficial to themselves; who have nothing to lose, and therefore expect to be gainers by every scramble; and who, of course, spend life in disturbing others, with the hope of gaining something for themselves. Under despotic governments they are awed into quiet; but in every free community they create, to a greater or less extent, continual turmoil; and have often overturned the peace, liberty, and happiness, of their fellow-citizens. In the Roman Commonwealth, as before in the Republics of Greece, they were emptied out, as soldiers, upon the surrounding countries; and left the sober inhabitants in comparative quiet at home. It is true, they often threw these States into confusion; and sometimes overturned the government. But if they had not been thus thrown off, from the body politic, its life would have been of a momentary duration. As things actually were, they finally ruined all these States. For some of them had, as some of them always will have, sufficient talents to do mischief; at times, very extensive. The Gracchi, Clodius, Marius, and Mark Antony, were men of this character. Of this character is every demagogue; whatever may be his circumstances. Power and profit are the only ultimate objects, which every such man, with a direction as steady, as that of the needle to the pole, pursues with a greediness unlimited and inextinguishable.

Formerly the energetic government, established in New-England, together with the prevailing high sense of religion and morals, and the continually pressing danger from the French, and the

savages, compelled the inhabitants into habits of regularity and good order, not surpassed perhaps, in the world. But since the American Revolution, our situation has become less favourable to the existence, as well as to the efficacy, of these great means, of internal peace. The former exact, and decisive, energy of the government has been obviously weakened. From our ancient dangers we have been delivered; and the deliverance was a distinguished blessing: but the sense of danger regularly brings with it a strong conviction, that safety cannot be preserved without exact order, and a ready submission to lawful authority.

The institutions, and the habits, of New-England, more I suspect than those of any other country, have prevented, or kept down, this noxious disposition; but they cannot entirely prevent either its existence, or its effects. In mercy, therefore, to the sober, industrious, and well-disposed, inhabitants, Providence has opened in the vast Western wilderness a retreat, sufficiently alluring to draw them away from the land of their nativity. We have many troubles even now: but we should have many more, if this body of foresters had remained at home.

It is however to be observed, that a considerable number even of these people become sober, industrious citizens, merely by the acquisition of property. The love of property to a certain degree seems indispensable to the existence of sound morals. I have never had a servant, in whom I could confide, except such as were desirous to earn, and preserve, money. The conveniences, and the character, attendant on the possession of property, fix even these restless men at times, when they find themselves really able to accumulate it; and persuade them to a course of regular industry. I have mentioned, that they sell the soil of their first farms at an enhanced price; and that they gain for their improvements on them what, to themselves at least, is a considerable sum. The possession of this money removes, perhaps for the first time, the despair of acquiring property; and awakens the hope, and the wish, to acquire more. The secure possession of property demands, every moment, the hedge of law; and reconciles a man, originally lawless, to the restraints of government.

Thus situated, he sees that reputation, also, is within his reach. Ambition forces him to aim at it ; and compels him to a life of sobriety, and decency. That his children may obtain this benefit, he is obliged to send them to school, and to unite with those around him in supporting a school-master. His neighbours are disposed to build a church, and settle a Minister. A regard to his own character, to the character and feelings of his family, and very often to the solicitations of his wife, prompts him to contribute to both these objects ; to attend, when they are compassed, upon the public worship of God ; and perhaps to become in the end a religious man.

I am, Sir, yours. &c.

## LETTER XIV.

Manner of forming new settlements, and character of new settlers continued.

*Dear Sir,*

THE settlement of a new country is an object which has not been hitherto described, I believe by any writer. At the same time, it exhibits the character of man, his enterprize, patience, perseverance, and power over this world, every where naturally a wilderness, in a light which cannot be uninteresting to a philosophical mind. As I have been not a little conversant with this subject, I will here give a summary account of the efforts, by which every part of this country has been changed from a forest into its present appearance.

In forming new settlements, it will be easily believed, the planters are necessitated to struggle with many difficulties. To clear a farm covered with a thick growth of large trees, such as generally abound in this country, is a work of no small magnitude. Especially is this true, when, as is usually the fact, it is to be done by a single man; and still more especially, when that man is poor, and obliged to struggle with many other discouragements. Yet this is the real situation of multitudes, who undertake enterprises of this nature.

When a planter commences this undertaking, he sets out for his farm with his axe, gun, blanket, provision, and ammunition. With these he enters the forest; and builds himself a shed, by setting up poles at four angles, crossing them with other poles, and covering the whole with the bark, leaves, and twigs of trees, except the South side, purposely left open to the sun and a fire. Under this shelter he dresses his food; and makes his bed of straw, on which he sleeps soundly beneath his blanket. Here he usually continues through the season: and sometimes without the sight of any other human being. After he has completed this shelter, he begins to clear a spot of ground: i. e. to remove the forest, by which it is covered. This is done in two ways; *girdling*, and

*felling, the trees.* The former of these I have already described. The latter has now become almost the universal practice: and wherever it can be adopted, is undoubtedly to be preferred. The trees are cut down, either in the autumn, or as early as it can be done in the spring; that they may become so dry as to be easily burnt up in the ensuing summer. After they have lain a sufficient length of time, he sets fire to them, lying as they fell. If he is successful, the greater part of them are consumed in the conflagration. The remainder he cuts with his axe into pieces of a convenient length; rolls them into piles; and sets fire to them again. In this manner they are all consumed; and the soil is left light, dry, and covered with ashes. These, so far as he can, he collects, and conveys to a manufactory of potashes if there be any in the neighbourhood; if not, he leaves them to enrich the soil. In many instances the ashes, thus gathered, will defray the expense of clearing the land.

After the field is burned over, his next business is to break it up. The instrument, employed for this purpose, is a large and strong harrow; here called *a drag*, with very stout iron teeth; resembling in its form the capital letter A. It is drawn over the surface, a sufficient number of times to make it mellow, and afterwards to cover the seed. A plough would here be of no use; as it would soon be broken to pieces by the roots of the trees. In the same manner the planter proceeds to another field, and to another; until his farm is sufficiently cleared to satisfy his wishes.

The first house which he builds, is formed of logs and commonly contains two rooms, with a stone chimney in the middle. His next labour is to procure a barn; generally large, well framed, covered, and roofed. Compared with his house, it is a palace. But for this a saw-mill is necessary, and is therefore built as early as possible.

It will be easily believed, that the labours, already mentioned, must be attended by fatigue, and hardships, sufficient to discourage any man, who can live tolerably on his native soil. But the principal sufferings of these planters, in the early periods of their business, spring from quite other sources. The want of neighbours to assist them; the want of convenient implements; and

universally the want of those means, without which the necessary business of life cannot be carried on, even comfortably ; is among their greatest difficulties. The first planters at Haverhill and Newbury, on Connecticut river, were obliged to go to Charlestown, more than seventy miles, to get their corn ground ; (there being no mill nearer to them,) and to obtain assistance to raise the frame of every building. At that time there was no road between these towns. The travelling was of course all done on the river. Mr. Page, the first settler of Lancaster, on the same river, seated himself in that township in 1766. For several years there was no family, beside his own, within many miles. He also was necessitated to get his corn ground at Charlestown ; distant more than one hundred and twenty miles ; but at length he relieved himself from this inconvenience by building a horse-mill.

In sickness, and other cases of suffering and danger, these planters are often without the aid either of a physician, or a surgeon. To accidents they are peculiarly exposed by the nature of their employments : while to remedies, beside such as are supplied by their own skill and patience, they can scarcely have any access. Even to procure the assistance, necessary in the critical season of female suffering, must be attended with no small difficulty.

As most of the first planters were poor ; and as many of them had numerous families of small children ; the burden of providing food for them was heavy, and discouraging. Some relief they found, at times, in the game, with which the forests were formerly replenished. But supplies from that source were always precarious ; and could never be relied on with safety. Fish, in the mild season, might often be caught in the streams, and in the lakes. In desperate cases the old settlements, though frequently distant, were always in possession of abundance ; and, in the mode, either of commerce, or of charity, would certainly prevent them, and theirs, from perishing with hunger.

To balance these evils, principally suffered by the earliest class of planters, they had some important advantages. Their land, usually covered with a thick stratum of vegetable mould, was eminently productive. Seldom were their crops injured by the blast, or the mildew ; and seldom were they devoured by insects.

When the wheat was taken from the ground, a rich covering of grass was regularly spread over the surface ; and furnished them with an ample supply of pasture, and hay, for their cattle.

Beside the abundance of their crops, they had the continual satisfaction of seeing their embarrassments daily decreasing, and their wealth, and their comforts, daily increasing. The value of this kind of property is enhanced by two causes: the labour, which is done upon it ; and the multiplication of settlers in its neighbourhood. Every good planter, who seats himself in a new township, increases the value of every acre, which it contains ; because he induces other men to settle around him. Accordingly, the owners of large, unsettled tracts give several farms to individuals, who are willing first to settle on them, that they may induce others to purchase the remainder. At the same time, every stroke of the axe leaves behind it more than the value of the labour : while the proprietor gathers another rich compensation in certain, and abundant crops. A farmer of my acquaintance advanced his property four hundred per cent, in twelve years, by placing himself on a new farm.

During this period also, the planter is cheered by the continual sight of improvement in every thing about him. His fields increase in number, and beauty. His means of living are enlarged. The wearisome part of his labour is gradually lessened. His neighbours multiply ; and his troubles annually recede. Hope, the sweetner of life, holds out to him at the same time, brighter and brighter prospects of approaching ease and abundance.

Among the enjoyments of these people, health, and hardihood, ought never to be forgotten. The toils, which they undergo ; the difficulties, which they surmount ; and the hazards which they escape ; all increase their spirits, and their firmness. A New-England forest, formed of hills and vallies, down which the waters, always pure and sweet, flow with unceasing rapidity ; or of plains, dry, and destitute of marshes, is healthy almost of course. The minds of these settlers, therefore possess the energy, which results from health, as well as that, which results from activity : and few persons taste the pleasures, which fall to their lot, with a keener relish. The common troubles of life, often deeply felt by

persons in easy circumstances, scarcely awoken in them the slightest emotion. Cold and heat, snow and rain, labour and fatigue, are regarded by them as trifles, deserving no attention. The coarsest food is pleasant to them; and the hardest bed refreshing. Over roads, encumbered with rocks, mire, and the stumps and roots of trees, they ride upon a full trot; and are apprehensive of no danger. Even their horses gain, by habit, the same resolution; and pass rapidly, and safely, over the worst roads, where both horses and men, accustomed to smoother ways, merely tremble, and creep. Even the women of these settlements, and those of every age share largely in this spirit. The longest journies, in very difficult roads, they undertake with cheerfulness, and perform without anxiety. I have often met them on horseback; and been surprised to see them pass fearlessly over those dangers of the way, which my companions and myself watched with caution and solicitude. Frequently I have seen them performing these journies alone.

Another prime enjoyment of these settlers is found in the kindness, which reigns among them universally. A general spirit of good neighbourhood is prevalent throughout New-England; but here it prevails in a peculiar degree. Among these people, a man rarely tells the story of his distresses to deaf ears; or asks any reasonable assistance in vain. The relief given is a matter, not of kindness merely, but of course. To do kind offices is the custom; a part of the established manners. This is seen every where; and is regularly experienced by the traveller; whom they receive as a friend, rather than as a stranger; as an object of good will, and not as a source of gain.

These things grow naturally out of their circumstances. In addition to the humane impressions, acquired by their early education, such offices become peculiarly valuable, and necessary, by their situation. Every case of distress is easily realized by all; because all have been sufferers. "*Miseris succurrere disco,*" may every new settler say with emphasis, as well as truth. Like sailors, these people learn from the evils of life mutually to feel, and relieve. This vivid sympathy mightily contributes to lighten the evils, and soothe the sufferings, incident to a new settlement;

and spreads cheerfulness, and resolution, where a traveller would look for little else, beside discouragement, and gloom.

Among the pleasures, furnished by the melioration of their circumstances, the exchange of their log-huts for decent houses must not be forgotten. Building, particularly with wood, must be cheap, where timber abounds. Within a few years, the industrious planter finds his circumstances so much improved, that he is persuaded to erect a permanent habitation. This is a change, always bringing with it a train of advantages. The comfort, the spirit, the manners, nay even the morals, of his family, if not of himself, are almost of course improved. The transition from a good house is, by the association of ideas natural to the human mind, a very easy one to good furniture; a handsome dress; a handsome mode of living; better manners; and every thing else, connected with a higher reputation.

That, which may be called *the second set of planters*, may be considered as regularly superiour to the first: and *the third*, when there is a third, is superiour to the second. By this time the country has chiefly assumed the aspect of good farming, and regular society. You will not understand, that I here intend all which is sometimes meant by these terms. A great difference is made, with respect to the state of society, by the governments, under which the different settlers live. In Massachusetts, where the system was comparatively stable, the character of the rulers well known, the laws wise, and good, and the administration such as compelled respect; where, in a word, the recent planters were under exactly the same government, as the inhabitants of the older towns; a regular state of society was introduced at a very early period. Here it was a thing of course; and every planter went upon his farm with a full conviction, that no change was to be expected in his civil concerns. Every thing here grew up, as a child in a well-educated family grows up, to habits of order, and happy intercourse: and no real chasm existed, unless accidentally, between the first excursion into the forest, and the complete population. This subject I will resume in my next letter; and am,  
Sir, yours, &c.

## LETTER XV.

State of Vermont—Its settlement—Account of its Government.

*Dear Sir,*

THE State of Vermont, and all its interests, came at once into the hands of a set of men, gathered suddenly from many parts of New-England, and in a great measure strangers to each other. Their education, manners, habits, views, and characters, were often very unlike; and not unfrequently opposed. The men, who, in such a state of things, first gain influence, are the restless, bold, ambitious, cunning, talkative, and those who are skilled in land-jobbing. In established society, influence is chiefly the result of personal character, seen, and known, through the period, in which that character is formed, and the conduct, by which it is displayed. In such society, notwithstanding the corruption of the present world, a man of worth and wisdom will, unless prevented by peculiar circumstances, be almost always more respectfully regarded, than persons destitute of these characteristics; and will have a superior efficacy on the affairs of those around him. But in a state of society recently begun, influence is chiefly gained by those, who directly seek it: and these in almost all instances are the ardent and bustling. Such men make bold pretensions to qualities, which they do not possess; clamour every where about liberty, and rights; are patriots of course, and jealous of the encroachments of those in power; thrum over, incessantly, the importance of public economy; stigmatize every just and honourable public expenditure, arraign the integrity of those, whose wisdom is undisputed, and the wisdom of those, whose integrity cannot be questioned; and profess, universally, the very principles, and feelings, of him, with whom they are conversing. These things, uttered every where with peremptory confidence, and ardent phraseology, are ultimately believed by most men in such a state of society. Ignorant of the true character of those, among whom they have just begun to reside, and knowing that they must necessarily give

their votes to somebody, they are pleased to be relieved from uncertainty, and still more pleased to find an object of their suffrages, so entirely coinciding with their own views : never mistrusting that the amount of all this parade of eloquence, and patriotism, may be expressed in this little sentence : " Will you please to vote for me?"

A considerable number of those, who first claimed, and acquired influence in the State of Vermont during its early periods, were men of loose principles, and loose morals. They were either professed Infidels, Universalists, or persons, who exhibited the morals of these two classes of mankind. We cannot expect, therefore, to find the public measures of Vermont distinguished, at that time, by any peculiar proofs of integrity, or justice.

The Constitution of this State was formed Dec. 25, 1777. By that instrument the Legislative power is vested in a House of Representatives, chosen annually by the freemen on the first Tuesday of September, and assembled annually on the second Thursday of the succeeding October. Two thirds of their number constitute a quorum.

The Executive power is lodged in a Governour, Lieutenant-Governour, and twelve Councillours ; chosen at the same time, and in the same manner. The Judges of their Courts are appointed annually by the Legislature, in conjunction with the Governour and Council.

A person, at all acquainted with the history of Representative government, must see at a glance, that this Constitution is lame and unhappy. A Legislature, formed by a single house, is in danger of becoming a tumultuous assembly. The individuals, who compose it, may possess personal respectability : but that character will be chiefly merged, and lost, in their union. The deliberations of such a body will at times be disorderly, violent, and indecent ; the result of feeling, party, private attachment, and public agitation ; and its decisions will be occasionally partial, and unjust.

In a single house of legislation the influence of one man, or of a small body of men, will commonly, prevail, at least during short

periods, whenever it is conducted with art and cunning, and supported with vehement declamation. Some of its members will be intoxicated by the sudden acquisition of popularity, and power; some of them will be bewildered through ignorance; some of them will be fascinated with the notice of their superiours; some will be beguiled by insinuation; and some will be seduced by promises of personal advantage. To trust the important interests of a community to such a body, is to launch them upon an ocean, without a compass, without a pilot, and often without a shore.

The want of energy in an Executive, is an evil, scarcely less fruitful. In such a State, a weak and powerless Executive will never be able to awe bad men: but bad men will usually awe the Executive. If men are to be protected in their lives, and rights; if they are to live in peace; in a word, if they are to enjoy the blessings of civilized society; such men must be deterred from disturbing either their neighbours, or the public.

The Judicial system of this State is not less unhappy. To obtain the office of a Judge, recourse will too often be had to party influence, intrigue, and cabal. When the office is obtained, the incumbent feels himself to be the creature of the party which put him in place; and knows that at the end of a year he can be annihilated by the same breath, which created him; that his existence as a Judge, or his removal from office, together with the consequent honour, and disgrace, are in the hands of those, by whom he has been appointed; and that, if he has not sufficient firmness to meet political ruin, he must gratify their wishes, even in his judicial administrations. Of course, he is assailed by the most dangerous inducements to violate his oath of office; to be treacherous to the interests of the State; and to be unjust to the parties, who come before him. Into such a situation, in times of political commotion, an honest man will reluctantly enter; because no such man will voluntarily offer himself to the perils of temptation. No man, who places a just value upon reputation, will be found in it; because he will see his character exposed to destruction. No independent man will consent to become such a tennis-ball of caprice, party, fraud, and corruption. The citi-

zens, as the consequence of their excessive jealousy of their rulers, and their excessive disposition to retain power in their own hands, must consent to be often judged by men, unqualified for this office, either by knowledge, or by worth.

I shall here be probably reminded, that the Supreme Executive of Connecticut, is as feeble, as that of Vermont, and that the Judges of the several Courts in that State are, in the same manner, chosen annually by the Legislature. I shall further be told, perhaps, that the inhabitants of Vermont are, in a great proportion, either such as were originally citizens of Connecticut, or children of those citizens. If the observations, which I have already made concerning Vermont, and other new settlements, are not considered as a complete answer to the objection, intended in these remarks; I shall take the liberty to add, that the government of Connecticut is fitted for no other country.

In no other country are united the same strong sense of religion, the same firm moral habits, the same enlightened education of the whole body of people, the same rivited love of good order, and the same powerful public sentiment, founded on them all, and established at the commencement of the Colony. The men, who originated the police of Connecticut, were a very different class of human beings from those, who formed the system of Vermont. Intelligence and piety flourished under the fostering care of those, who founded Connecticut. They are growing up in Vermont, in spite of their founders.

I observe further, that the weakness of the Executive is undoubtedly a defect in the Connecticut system; and that the dependence of the Judges, notwithstanding they are regularly appointed, until their resignation or their death, is a very gross defect.

I add finally, that the system of Connecticut could not be commenced successfully by the present inhabitants. Our ancestors, with *their* spirit, and in their circumstances, were able to give it both existence, and efficacy. We, by the habits which itself has created, are thus far (1807) able, and it is no small honour to us, that we are able, to preserve it. Their intelligence and virtue

were sufficient to create our institutions, and transmit them to us. Happily, however inferior the character may be thought, ours are sufficient to keep these institutions alive.

In the year 1785 a Council of Censors was chosen; whose office was designed as a restraint on this general tendency to dissolution of administration. Their number is thirteen. They are chosen septennially; and continue in office one year. These men are to enquire whether the Constitution has been violated; the legislative and executive powers properly exercised; taxes equitably levied; the revenue of the State wisely expended; and the laws duly executed. They have power to send for persons, papers, &c.; to pass public censures; to order impeachments; and to recommend the repeal of all laws, which are contrary to the Constitution. They may also call a Convention, if they judge it necessary, to alter the Constitution. This Convention must assemble two years after the sitting of the Council: and the alterations, projected, must be published at least six months before the delegates are chosen.

That this Institution was well intended is indubitable. Equally certain is it, that its efficacy either to remove, or redress, public difficulties can amount to nothing. The Constitution has placed all the power of the State in the hands of the Representatives; and to their decrees every effort will be opposed in vain. Nor may this evil find a remedy, until the inhabitants have learned by the mere dint of suffering, that in order to preserve their freedom entire, they must place in the hands of their rulers a greater portion of their power. Such sufferings, to a considerable extent, the inhabitants have already begun to experience. The manner in which the judicial system is administered, has particularly excited very serious complaints on the part of all sober men. Their Courts are, in several instances, formed of just such materials, as accord with the reasoning above, and such, as all persons, versed in the political history of mankind, must necessarily have foreseen.

The religious, and of course the moral state of Vermont is improving. Within five years, preceding the present time,\* twen-

ty ministers have been settled in this State; and six, within one year, on the Eastern side of the mountains. Frequent, and considerable, revivals of religion have contributed not a little to increase the number of Clergymen, and to change the moral aspect of the country. These have generally existed with circumstances, honourable to the character of the converts, and to the religion, which they have professed. Neither enthusiasm, nor superstition, has soiled their profession. Sober, rational, essentially amended in their character, and visibly reformed in their conduct, they have, with very few exceptions, satisfactorily evinced their own sincerity, and the excellence of the christian system. Should this happy influence, so desirably begun, become generally prevalent; its effect on the good-order, peace, and prosperity, of the State will be such, as to preclude the necessity of all other means of melioration.

Upon the whole, the State of Vermont, from the richness of its soil; the variety, and value, of its productions; the salubrity of its climate; the rapid increase of its population; the hardihood, industry, and enterprize, of its inhabitants; the melioration of character, which they have begun; and the more extensive improvement, rationally promised by the influence of the New-England institutions on the present and succeeding generations; cannot but be regarded as one important nursery of the human race; and as a country, where a great mass of happiness and virtue may be fairly expected in future ages. Many of the evils, which I have mentioned, will naturally furnish their own cure. Others, the wisdom and moderation of enlightened men will in all probability remove.

I am, Sir, yours, &c.

\* 1807.

## LETTER XVI.

Hampton—Pulteney—Granville—Westfield—Kingsbury—Sandy-Hill—Glen's Falls—Queensbury—Schenectady—Union College—Attack of the French and Indians on Schenectady in 1690—Rev. Dr. Romeyn—Rev. Dr. John B. Smith—Rev. Robert Smith.

*Dear Sir,*

FROM Fair-Haven we entered the township of Hampton, in the State of New-York. Our road lay along Pulteney river, through a succession of beautiful intervals, divided into a number of valuable farms, and ornamented by several neat houses. The hill immediately West of this river is also, near its Northern termination, an elegant piece of ground; well cultivated, and crowned in a picturesque manner by a church on its summit. The mouth of Pulteney river forms East Bay, one of the Southern terminations of lake Champlain, and the principal part of the Southern boundary of Fair-Haven. The other parts of the township of Hampton are rough and disagreeable.

In 1790, this township contained 463 inhabitants; in 1800, 700; and, in 1810, 820.

In the year 1806 we crossed Pulteney river, about nine or ten miles from Granville. The township of Pulteney is pleasant, lying upon two fine mill-streams; which, both before and after their confluence are lined with rich and handsome intervals. It includes a well-built village, and a collection of prosperous farms. In 1790 it contained 1,221 inhabitants; in 1800, 1,697; and, in 1810, 1,905.

Granville, which is situated immediately South of Hampton, is a much pleasanter, and better, township. A considerable part of it lies on the branches of Pawlet river; which has its origin in Dorset, in the County of Rutland, and empties its waters into lake Champlain at South Bay. The houses are built in a scattered manner; yet there is a small village, principally on the Eastern side of one of these branches. Its general appearance is that of moderate thrift. It presents a fine view of the range of

mountains between lake Champlain and lake George. A revival of religion took place here in the year 1806.

Granville, like most other townships in the State of New-York, is extensive; and contained, in 1790, 2,240 inhabitants; in 1800, 3,175; and, in 1810, 3,717.

We dined at Granville; and after dinner rode through Westfield, and Kingsbury, to Sandy-Hill. Westfield is a very large and unpleasant tract of land. The soil is chiefly clay, and indifferently fertile; the surface, composed of hills and vallies, devoid of beauty; the settlements recent, and thinly scattered: the houses chiefly log-huts; and the inhabitants poor, and unthrifty. To complete the dullness of this tract, the few streams, which we saw were exactly like those mentioned in the description of Addison, and Bridport. Most of them were successions of puddles, lying in a loathsome bed of clay, between steep, ragged banks, and of the colour of dirty suds. So offensive were these waters, that although distressed with heat and thirst, our horses, whenever they approached them in order to drink, suddenly drew back with strong indications of disgust. A person, accustomed only to the limped streams of New-England, can form no conception of the disagreeableness of this fact. We ourselves suffered from it greatly: for, although parched with thirst, and faint with the unusual heat, we were unable, for a great distance, to find any thing, which we could drink.

Westfield contained in 1790, 2,103 inhabitants; in 1800, 2,502; and, in 1810, 3,110.

In this tract we crossed Wood Creek, and entered the Skeenesborough road, about eight miles below that village. We had taken this circuitous course, to avoid that settlement; which, we were told, was distressed with sickness. For some time our road lay along the Northern bank of this stream; and became much more agreeable, particularly, as we were sheltered by a continued forest from the intense beams of the sun.

About a mile before we arrived at Fort Anne, we rode over a hill, jutting into the creek, named Battle Hill. Here the Americans, retreating before the army of General Burgoyne, attacked a

British regiment, commanded by Lieut. Col. Hill, with great spirit; and would probably have taken or destroyed the whole corps, had they not been deceived into a belief, that their enemies had received a reinforcement.

At the village of Fort Anne we stopped to examine the spot, where the fortification, formerly known by this name, was erected. It was built in order to facilitate an intended expedition against Canada in the year 1709; and stood just at the bend, where the Eastern course of the creek commences. It was merely an enclosure of strong palisadoes; sufficient, however, to check the savages in their incursions from South Bay upon Hudson's river. For canoes and batteaux the creek is navigable to this spot. The stumps of the palisadoes, if I may so call them, were still remaining; and recalled to my mind some of the painful impressions, which it had received concerning Indian ravages in the years of childhood.

The village of Fort Anne is built chiefly on a single street, running from North to South. The houses are recently, and for so new a settlement neatly, built. The inhabitants hope, that this will hereafter be a place of considerable business.

From Fort Anne to Sandy-Hill, ten miles; the soil is principally clay. About three miles of the road are causeyed with logs: a work of immense labour, performed, if we may trust public accounts, by the army of Gen. Burgoyne; but, as I was told on the spot, by the American army. I have also been repeatedly told, and I presume with truth, that this causey was built by the British and Provincial troops in the last Canadian war. The ground is so miry, that an army could not have passed over it without a causey. In the Revolutionary war the Americans probably repaired it: and the soldiers of Gen. Burgoyne may have added to the repairs. The state of this ground has been also exhibited as so savage and difficult, so broken with creeks and marshes, that the army of Gen. Burgoyne could hardly advance more than a mile in a day. There is not a single stream here, of any importance. It is further said, that this army was obliged to construct no less than forty bridges. The word bridges, here, must denote

little passages over rills, of the smallest magnitude : for there is not a single bridge, of any size, on the road. Even with this explanation, the number must be doubled, if not tripled. The principal difficulty, found here by Gen. Burgoyne, was, I presume, this : the Americans in their retreat felled as many trees, as they could, across the road : and the army was obliged to take this road, because there was no other. To the British soldiers, who were unskilled in cutting timber, the removal of these obstructions must have been a very laborious and difficult work. Had there not been a causey here before this period, the Americans themselves could not have passed through this country : for the marsh, and the forest, must have obstructed their passage as much, as that of the British. But as they are accustomed to labours of this nature, they think little of them. Hence, before Gen. Burgoyne marched through this tract, the world never heard any thing concerning the tremendous obstacles, which here so formidably opposed the progress of an army. As to the savage nature of the place ; there is a marsh here, not a whit more embarrassing than marshes generally are : and the forest, elsewhere, is much less shaggy and difficult than a great part of American forests. The causey is in tolerable preservation ; and, with an additional covering of earth, would furnish a pleasant road.

Kingsbury is a large township, containing, beside other settlements, two villages : Kingsbury, and Sandy-Hill. The village of Kingsbury is built on high ground, sloping handsomely towards the South-East. From twenty to thirty houses are assembled here, if I do not misremember, around a small, decent church. Their appearance indicates, that the inhabitants are in comfortable circumstances. An extensive, and in some respects interesting, prospect is presented on this spot to the eye of a traveller.

Sandy-Hill lies about five miles from Kingsbury on the Hudson ; where that river, terminating its Eastern course, makes a remarkable bend to the South ; a direction which it follows from this place to the ocean. The site of the village is a pine plain ; elevated from one hundred to two hundred feet above the bed of the river. It contains perhaps, twenty houses ; several of them

neat. The two great roads, from the Eastern side of lake Champlain, and the Western side of lake George, in their progress towards New-York, unite here; and make it a place of frequent resort; and some trade. It is often visited by gentlemen and ladies in their excursions to lake George: a scene of pre-eminent beauty, which I shall have occasion to describe more particularly hereafter. We lodged in a miserable inn; the proprietor of a much better one being occupied in building a house, and unable to receive us.

In 1790, Kingsbury contained 1,120 inhabitants; in 1800, 1,651; and, in 1810, 2,272.

Thursday, October 4th, we left Sandy-Hill; and rode two miles and a half up the Hudson, to see the cataract, called from a respectable man, living in the neighbourhood, Glen's Falls. The road to this spot passes along the North bank of the river.

The rock over which the Hudson descends at this place, is a vast mass of blue limestone, horizontally stratified; and, I believe, exactly resembling that, which produces the falls of Niagara. How far this stratum extends Northward and Westward, I am ignorant. Down the river it reaches certainly as far as Fort Edward.

The river at this place runs due East; and is forty rods in breadth. Almost immediately above the cataract is erected a dam, eight or ten feet in height, for the accommodation of a long train of mills on the North, and a small number on the South bank. Below the dam the mass of limestone extends, perhaps, thirty or forty rods down the middle of the stream; leaving a channel on each side. That on the North is about one third of the breadth of the river. That on the South, where narrowest, is perhaps a tenth; and, where widest, is divided into two by another part of the rock. The breadth of both, taken together, is not far from that of the North channel.

The part of this rock, which is nearest to the dam, is washed by the stream; and its surface is wrought every where into small figures, resembling shells. A short distance below the dam, it is covered with earth for about twelve or fifteen rods each way;

and, to a considerable extent, with pines and underwood. Below the road, which between the bridges crosses this ground, the rock is divided into two arms; with a deep channel between them hollowed out by the stream, and by the weather. One bridge crosses the North channel; and two, the South; in a direction from North-West to South-East.

The perpendicular descent of the water at this place is seventy feet. The forms, in which it descends, are various beyond those of any other cataract within my knowledge. All the conceivable gradations of falling water from the mighty torrent to the showery jet d'eau, are here united in a wonderful and fascinating combination. In the channel on the North side, twenty rods in breadth near the dam, and about twelve at the bridge, the greatest mass of water descends in four principal streams, divided by three huge prominences of the rock, and in several smaller ones. The prevailing appearance here, is that of sublimity: as the river descends either in great sheets, or violent torrents. There are, however, several fine cascades in this compartment; and the effect of the whole is not a little increased by innumerable streams, torrents, and jets, from the long succession of mills on the North shore.

The Southern division of this scene is, however, a still finer object than the Northern. On the North side of this channel the river has worn a ragged, perpendicular chasm through the rock, about thirty feet in breadth, eight or ten rods in length, and fifty or sixty feet in depth. Through this opening pours a single torrent in a mass of foam; and is joined by ten or twelve currents, rushing from the Southern side with every wild variety of form, and with a beauty, and magnificence, incapable of being described.

On the Eastern part of the island, below the road, the water has worn three passages beneath the surface quite through the rocky points, which border the channel, mentioned above: two, through the Northern arm of the island; and one, through the Southern. These passages are about three rods in length; and sufficiently wide, and high, for a man to pass conveniently through

them. The surface of the rock, above them, is smooth, and entire. I was at a loss to conceive what cause has produced these passages; as their direction was exactly at right-angles with the current. In the year 1802, when I visited these falls the third time, I found a fourth passage, cut through one of the same arms, in all respects similar to those which I have mentioned. If it existed at all in the year 1798, it was so small, that it was not only unobserved by us, but had never been discovered by any of the neighbouring inhabitants. So remarkable a fact induced me to search for the cause; and I soon became satisfied. This stratum of limestone, by means of its numerous crevices, is almost every where pervious to the water; and is of such a texture, as to be easily, and rapidly, worn away by its force. When a cold season succeeds a freshet, a stone, wherever it happens to be wet, is broken by the frost; and, as it is evident from the numerous square blocks, here, and throughout this vicinity, into which it has been fashioned by the same cause, is prone to crack perpendicularly to the surface of the strata. Wherever there is a fissure, the water pours through it; and by the force of the current, and the aid of continual frosts, a chasm is soon formed, of considerable extent.

In this manner the whole channel of the Hudson at this place has been hollowed out. Originally these falls were in the neighbourhood of Fort Edward: five miles below their present station. During a long succession of ages, the river has gradually worn this deep channel backward to this place. Among other proofs of the facts here asserted, this is one. In the year 1799, I visited this spot the second time; and with a good deal of care drew outlines of every thing material, relative to their figure and appearance. In my third visit, three years afterwards, I found them so much altered, that the resemblance was in a considerable measure lost. The great features were the same: but the smaller ones were, even in this little period, essentially changed. What, then, must have been the efficacy of these powerful agents, during more than forty centuries.

The shores of the river, below the falls are wrought, so far as they are in sight, into many forms; smooth, rough, convex, con-

cave, perpendicular, overhanging, and generally very irregular in their appearance.

The whole effect of this scene may be arranged under the heads of grandeur, variety, wildness, and beauty. The grandeur arises from the height, perpendicularity, and raggedness, every where seen, of this immense mass of rock; and from the dimensions, and force, of the torrent. The wildness is extreme, the variety endless, and the beauty intense. From some pictures, which I have seen, I should believe Salvator Rosa might have exhibited this group of objects with advantage; but it would demand the whole power of his pencil.

Queensbury, through a considerable part of which I passed in the year 1802, appears to have a lean soil, and to be thinly parcelled out into very scattered settlements, of a recent date. The number of its inhabitants, in 1790, was 1,080; in 1800, 1,435; and, in 1810, 1,948.

From the falls we rode to the upper part of Stillwater; where we lodged: our journey this day was twenty-eight miles. The first five or six miles we passed over a pine plain, newly, and thinly settled by a collection of very poor people, in log-houses. We then came again to the river; and passed, in a good road, through a very pleasant country, which I shall describe hereafter.

The next morning we left Stillwater and rode to Schenectady: thirty-one miles; of which we lost four by our ignorance of the country. The first ten lay along the Hudson in the townships of Stillwater, and Half Moon. Then, turning Westward, we ascended the hills; or rather the brow of the elevated country, which borders the valley of this river. Between this ascent, and Schenectady, the country is chiefly composed of plains, and very gradual swells. The plains are covered with yellow pine; the swells principally with white pine, oak, and hickory. The plains are barren: the swells in favourable seasons yield good crops of wheat, peas, and grass. The three last miles, our journey was on the intervals of the Mohawk; and was very pleasant.

We arrived at Schenectady about seven. On Saturday a heavy rain commenced with a North-East wind; and continued three

days. We were, therefore, prevented from pursuing our journey until the following Tuesday; but had no reason to regret our delay.

Schenectady is situated on the South side of the Mohawk: fifteen miles North-West of Albany; and about the same distance from the confluence of the Mohawk with the Hudson. It is built on an interval anciently overflowed by the river, and now very little elevated above its highest freshets. On three sides it is nearly enclosed by the brow of a lofty pine plain; always an unsightly disagreeable object. The surface, as you would suppose, is level; and the soil rich. The streets cross each other often, and, in many instances, at right-angles; yet, from the difference of the distances between some, and the obliquity of other, streets, the eye receives no impression of regularity. The houses are chiefly ancient structures of brick, in the Dutch style: the roofs sharp; the ends toward the street; and the architecture uncouth. A great number of them have but one story. There are three churches here: a Dutch, a Presbyterian, and an Episcopal: all of them ordinary buildings. The town is compact; and one or two of the streets are paved. The number of inhabitants in this township was, in 1790, 4,228; and, in 1800, 5,289.

The people of Schenectady are descendants of the Dutch planters, mixed with emigrants from Scotland, Ireland, England, and New-England.

The government of this city is vested in a Mayor, Aldermen, and Common Council.

Schenectady formerly became wealthy by engrossing most of the trade, in furs and peltry, carried on with the Indians. In consequence of the Revolutionary war, and the settlement of the interior country, this trade has for many years ceased; and with it, that accumulation of property, of which it was the source. Within a few years past the inhabitants have begun to throw off the burden of discouragement, under which they had long laboured, and to apply themselves to other business, with considerable success. Since I passed through this place in 1792, a number of the old houses have been pulled down, and a great number of new

ones built in the English style. Should this spirit increase; their wealth, which is still considerable, may become an active capital, and restore to Schenectady a part of its former prosperity.

The morals of the inhabitants, particularly of the inferiour classes, are, extensively, upon a low scale. Among other causes, this is one: The merchandise, which passes into the Western country, is usually embarked, here, on the Mohawk. Of course, the numerous boatmen, employed in transporting it, make this their place of rendezvous: and few collections of men are more dissolute. The corruption, which they contribute to spread among the ordinary inhabitants, is a greater evil than a stranger can easily imagine.

In the year 1794, a Seminary was begun in this place, styled Union College: a name, said to be given to it, because men of the several religious denominations united in furnishing the means of its existence. The principal contributors to it were, however, the Dutch inhabitants of Albany, Schenectady, and the surrounding country. These, as I have been informed, agreed, that the College should be located where the largest contributions were made. The people of Schenectady won the prize.

This seminary, together with Columbia College in New-York, and all the incorporated schools in the State, is under the superintendence of a Board, styled the Regents of the University of *Columbia*. A body of Trustees, selected indifferently from every respectable class of citizens, possesses the immediate controul of its concerns. The Faculty consists of a President, and four Professors;\* who perform the same duties, which, in New-England seminaries, are allotted to Tutors. The number of students was at this time forty-seven.† This College is in possession of a philosophical apparatus, lately purchased for £300 sterling. The public commencement is holden in May.‡

\* One has since been added. There are also three tutors.—*Pub.*

† They amount this year (1819) to upwards of two hundred.—*Pub.*

‡ It has since been changed to the last Wednesday in July.

A college for the reception of this institution was at the time of our journey, raised to the base of the third story. It is built of leaden-coloured stone, dug up in the neighbourhood, and fortunately discovered since the edifice was projected.\* The windows are arched with a brown free-stone, and based with a dark-coloured marble of a fine texture, lately found here also. It is intended to contain a hall, library, a public room for the Commencement exhibitions, recitation rooms, a philosophical chamber, and rooms for the residence of the Faculty, and their families. The students are to board, and lodge, in the city. This arrangement must, I think, be unhappy; and cannot have been devised by persons, experienced in the management of such a seminary. Private buildings would be far more agreeable residences for the families of the Faculty: while the students, located in the college under the eye of their instructors, would be secured from a multitude of evils, to which, while lodging abroad, they cannot fail of being exposed.

The country, from which Union College will naturally derive its students, particularly on the West and North, is very extensive, and rapidly increasing in wealth and population. Its funds are already considerable: and the State appears disposed to give it liberal aid.

The prospects in the near neighbourhood of the city are, in several respects, pleasant. The river is a noble stream; nine hundred feet in breadth. The intervals are very handsome. On the North side particularly, directly opposite to the city, there is one of the most beautiful farms, which I have seen; the property of the Hon. John Saunders. It consists of a spacious and delightful interval, and an extensive tract of upland, declining easily towards the South; and yields on its various soils most of the productions, found in this climate. At the same time it commands a rich view of the Mohawk, both above and below; of its beautiful intervals; of Schenectady, and of the surrounding country.

\*The college buildings at present are two handsome brick buildings, each two hundred feet long, and four stories in height. The library has about five thousand volumes. The number of alumni from 1794 to 1818, was seven hundred and fifty-nine.—*Pub.*

In the year 1690, Schenectady was destroyed by a party of Canadian French, and Indians: most of them Mohawks, whom the French had seduced from their attachment to the English. This party consisted of three hundred men; and was one of three, sent by the Count De Frontenac to distress the British Colonies. The other two proceeded against New-Hampshire, and the Province of Maine, where one of them, under Hertel De Rouville, destroyed Dover in the manner already related. The body, which attacked Schenectady, was commanded, according to Colden, by Monsieur De Ourville; according to Dr. Trumbull; (for which he quotes the letters of Colonel Schuyler, and Captain Bull,)\* by D'Aillebout, De Mantel, and Le Moyn. The Mohawks were, or had lately been inhabitants, of Caghnawaga: a village up the river, about twenty-five miles from Schenectady. Of course they had been familiarly acquainted with the town, and often entertained by its citizens. The French were chiefly what are called Indian traders. They arrived in the neighbourhood on the 8th of February; when the season was so cold, and the snow so deep, that it was thought to be impossible for an enemy to approach. The French commander sent some of the Indians, as spies, to discover the state of the town. These men were seen lurking in the neighbourhood; and this fact was publicly announced; but the people were so satisfied of their safety, that they paid no regard to the information. Not even a sentinel was employed to watch the advent of the supposed enemy. This negligence was fatal to them. The French afterwards confessed, that they were so reduced by cold, hunger, and fatigue, as to have formed the resolution to surrender themselves prisoners, if they found the least preparation for resistance. But, learning from the spies, that the town was perfectly defenceless and secure, they marched into its centre the following evening; raised the war-whoop; and, having divided themselves into little parties, broke open the houses, set them on fire, and butchered every man, woman, and child, on whom they could lay hands. "No tongue," says Colonel Schuyler, "can express the cruelties, which they committed." Some

\* Captain Bull was on the spot.

of the inhabitants sought for safety in flight; and ran naked through the snow into the fields, and forests. Others endeavoured to hide themselves within the town from the fury of their murderers; but were forced from their retreats by the flames, and either killed or carried into captivity. Sixty-three were butchered in this inhuman manner. Twenty-seven more were made prisoners. Of those who escaped, twenty-five lost their limbs by the severity of the cold.

The cruelties, perpetrated here, were only the customary consequences of a Canadian irruption. The French stimulated the Savages to every inhuman act; and, when charged with these fiend-like violations of every law, and every principle, apologized for themselves by declaring, that they were unable to restrain their barbarity.

I cannot quit this town without paying a merited tribute of respect to three gentlemen, in whose company we found not a little pleasure, while we were here.

The Rev. Doctor Romeyn was a native of Schenectady. He was educated at Princeton; was settled in the Dutch church in the year 1766, and continued here in the ministry many years. His mind, originally vigorous, was enlarged by extensive acquisitions of solid learning; and his life was adorned with the virtues of the ministerial character. Dignified in his deportment, catholic in his disposition, zealous and faithful in his labours, eminent for his wisdom, and distinguished for his piety, his character was highly respected throughout this country; and his memory is held in great veneration, wherever he was known; particularly by the church and congregation, over which he presided.

Doctor John Blair Smith was a native of Pennsylvania, brother of President Smith of Nassau Hall, and son of the Rev. Doctor Robert Smith of Pequea, Pennsylvania. He was educated at Princeton; and took the degree of A. B. in the year 1773. He was first settled in the ministry at Hampden and Sydney, in Virginia, in the year 1779; and was, at the same time, made President of an infant seminary, called Hampden Sidney College. After some time, however, he relinquished his presidency, because

he found a faithful discharge of its duties incompatible with those of his ministry. In 1791, he was invited to the third Presbyterian church in Philadelphia. Here he continued until the year 1795; when he was chosen President of Union College. His principal inducement to each of these removals was the hope of establishing his health. While he resided here, he actually regained it; and in answer to the repeated solicitations of his congregation in Philadelphia, returned to that city, in May 1799. Here he was seized with the yellow fever; and died on the 22d of the following August.

Doctor Smith was an excellent minister of the Gospel. His understanding, and his acquisitions, were respectable; his imagination brilliant; his affections fervid; and his eloquence ardent, impassioned, and persuasive. His character, and life, were, also, in an eminent degree amiable, and exemplary. To the employments of a minister he was intensely devoted: and while he gained in this office distinguished reputation, he had the satisfaction to see "the pleasure of the Lord" unusually "prosper in his hands."

The Rev. Robert Smith was placed over the Presbyterian congregation in this town, in the year 1796. His character resembled in many traits that of the gentleman, last mentioned: but he excelled him, and most other men, in amenity and tenderness of disposition, and sweetness of deportment. So engaged was he in discharging the duties of his function, that neither the remonstrances of his friends, nor the encroachments of disease, could induce him to remit them in any such degree, as a due regard to his health obviously demanded. In an employment so important he scarcely thought, that he could expend his strength too freely. That he was justified in these opinions by his own mind cannot be questioned; although it cannot be doubted by others, that they were seriously erroneous. To this zeal, cherished by the best intentions, he sacrificed a considerable number of years, through which he might otherwise have lived; and added his own name to the melancholy list of those worthy men, who have found an untimely grave, because they were in too much haste to do good.

After Mr. Smith had resided here a few years, finding his health still declining, he accepted a call from the Presbyterian congregation in Savannah, in the year 1801, where, a short time after, he died. He was greatly beloved and respected, wherever he resided; and will be remembered only with esteem, affection, and sorrow.

I am, Sir, yours, &c.

## LETTER XVII.

Albany—Settled by the Dutch—Observations on publick taste—Trade of Albany—Major-General Schuyler—Greenbush—Schodac—Stephentown—New-Lebanon.

*Dear Sir,*

TUESDAY, October 4, we left Schenectady in the morning; and rode to Albany: sixteen miles. The road passes over a pitch-pine plain, nearly a perfect flat, chiefly covered with a forest; the soil miserably lean; the houses few, and poor; and the scenery remarkably dull, and discouraging. The road also is encumbered with sand; and, unless immediately after a rain, covered with an atmosphere of dust.

Albany is the second town in this State. From New-York it is distant one hundred and sixty miles; from Boston one hundred and sixty-five; from New-Haven one hundred and seven; and from Quebec South by West, three hundred and forty.

It was first settled about the year 1612; and the spot, where it was afterwards built, was visited by the celebrated English navigator, Henry Hudson, in 1609. It was first called Beverwyck; then fort Orange; then Williamstadt. The name of Albany it received in 1664.

Albany was a Dutch Colony; and, until within a few years, the inhabitants have been, almost without an exception, descendants from the original settlers. From this fact it has derived its whole aspect, and character. The houses are almost all built in the Dutch manner; standing endwise upon the street; with high, sharp roofs, small windows, and low ceilings. The appearance of these houses is ordinary, dull, and disagreeable. The house, first erected in this town, is now standing; and was built of bricks, brought from Holland. If I were to finish this picture according to the custom of poets and painters, and in obedience to the rules of criticism, by grouping with it animated beings; I should subjoin, that the master of the house, and often one or two of his

neighbours, are regularly seen, sitting\* in a most phlegmatic composure in the porch, and smoking with great deliberation from morning until night.†

The site of Albany is an interval on the Western side of the Hudson, and the brow of an elevated pine plain, rising rapidly at a small distance from the river. The soil of the elevation is clay. Both grounds easily imbibe, and retain, water. The streets therefore, few of which have been paved until very lately, have been usually incumbered with mud, so as at times to render travelling scarcely practicable. When I was in this city, in the year 1792, a waggon, passing through the heart of it, was fairly mired in one of the principal streets.

Since that period, an essential change has taken place in Albany. A considerable number of the opulent inhabitants, whose minds were enlarged by the influence of the Revolutionary war, and the extensive intercourse which it produced among them and their countrymen, and still more by education, and travelling, have resolutely broken through a set of traditionary customs, venerable by age, and strong by universal attachment. These gentlemen have built many handsome houses in the modern English style; and in their furniture, manners, and mode of living, have adopted the English customs. To this important change the strangers, who within a few years have become a numerous body of the inhabitants, have extensively contributed. All these, from whatever country derived, have chosen to build, and live, in the English manner.

The preference, given to the customs of the English, must descend with increasing influence to their children. In the Eng-

\* 1798.

† That this custom is not new, may be seen in the following passage from the travels of Professor Kalm, June 1749. Speaking of Albany, he says, "The street doors are generally in the middle of the houses, and on both sides are seats, in which, during fair weather, the people sit and spend almost the whole day, especially on those which are in the shadow of their houses. In the evening these seats are covered with people of both sexes; but this is rather troublesome, as those who pass by are obliged to greet every body, unless they will shock the politeness of the inhabitants of this town."

*Kalm, Vol. 2, p. 92, 2d edition, Lond.*

lish language all accompts, instruments of conveyance, records and papers employed in legal processes, must be written. The attainment of this language has, therefore, now become indispensable to the safety, as well as to the prosperity, of every individual. Urged by this necessity, and influenced by the example of their superiours, the humblest classes of the Dutch must, within a short period, adopt the English language, and manners. Within two generations there will probably be no distinction between the descendants of the different nations. Intermarriages are also becoming more frequent; and will hasten this event.

The streets of Albany are, in a loose sense, parallel, and right angled, to the river. The ground admitted, very happily, of a regular location: but, as in other places, this beautiful object was unthought of by the first settlers. Market, Pearl, and State-streets, the principal ones, are straight, and handsome. The two former are parallel with the river; the latter meets them at right angles.

The public buildings in this town are a State-house; two Dutch, two Presbyterian, one Episcopal, one German Lutheran, one Methodist, and one Roman Catholic, churches; a building, containing the offices of State, two banks; a prison; an arsenal; a hospital; a City Hall; and a Tontine Coffee House. One of the Dutch churches is new, handsome, and ornamented with two towers crowned with cupolas. None of the other public buildings claim any particular attention.

Since I visited this city in 1792, it has, fortunately I think, been ravaged by two fires, one of them supposed, the other known to be kindled by incendiaries. The tenants of the houses which were burned have in many instances been sufferers, but the town and the proprietors have gained much. The house lots have commanded a higher price than could have been obtained both for houses and lots antecedently to the fires, and the town has already been improved not a little in its appearance and will probably be much more improved hereafter. There are persons who will imagine this to be a matter of little consequence. I wish them to consider for a moment the following hints.

There is a kind of symmetry in the thoughts, feelings, and efforts of the human mind. Its taste, intelligence, affections, and conduct are so intimately related that no preconception can prevent them from being mutually causes and effects. The first thing powerfully operated on, and in its turn proportionally operative is the taste. The perception of beauty and deformity, of refinement and grossness, of decency and vulgarity, of propriety and indecorum is the first thing which influences man to attempt an escape from a grovelling, brutish character; a character in which morality is effectually chilled or absolutely frozen. In most persons this perception is awakened by what may be called the exterior of society, particularly by the mode of building. Uncouth, mean, ragged, dirty houses constituting the body of any town, will regularly be accompanied by coarse grovelling manners. The dress, the furniture, the equipage, the mode of living and the manners will all correspond with the appearance of the buildings and will universally be in every such case of a vulgar and debased nature. On the inhabitants of such a town it will be difficult if not impossible to work a conviction that intelligence is either necessary or useful. Generally they will regard both learning and science only with contempt. Of morals except in the coarsest form, and that which has the least influence on the heart, they will scarcely have any apprehensions. The rights enforced by municipal law they may be compelled to respect, and the corresponding duties they may be necessitated to perform. But the rights and obligations, which lie beyond the reach of magistracy, in which the chief duties of morality are found, and from which the chief enjoyments of society spring, will scarcely gain even their passing notice. They may pay their debts but will neglect almost every thing of value in the education of their children.

The very fact that men see good houses built around them will more than almost any thing else awaken in them a sense of superiority in those by whom such houses are inhabited. The same sense is derived in the same manner from handsomer dress, furniture, and equipage. The sense of beauty is necessarily accom-

panied by a perception of the superiority which it possesses over deformity, and is instinctively felt to confer this superiority on those who can call it their own over those who cannot. This I apprehend is the manner in which coarse society is first started towards improvement; for no objects but those which are sensible can make any considerable impressions on coarse minds. On these grounds I predicted to my friends in this town a speedy change for the better in its appearance, and in the character and manners of its inhabitants. I have since seen this prediction extensively fulfilled.

It will perhaps be asked here, whether all that has been said and believed concerning the virtue of cottages, and the purity of humble life, is erroneous; and whether splendour and polish are necessary to sound morals; whether wealth ceases now to draw luxury, and other vices in its train; and whether the golden mean has, by some strange revolution in human nature, become dangerous to piety, while ambition and show have, in consequence of a revolution not less strange, actually assumed the province of its foster-parents. To these questions I answer in the negative. There are virtuous cottages still; though their number is now, and always has been, less than it has been supposed by the fancy of the poet and the novelist; and sound morals can now be found where there is neither polish nor splendour. But the debate is not between cottages and palaces, nor between poverty and opulence; it lies between taste and the want of it, between grossness and refinement. The mediocrity which has been dignified with the name of golden, and which prevails more extensively in the Northern American states than in any other country, is, in mathematical language, a variable quantity; rising and falling, as what is called wealth in any country, rises or falls. Its golden nature consists, not in the amount of a man's possessions, but in the relative situation in which it places him as it respects the extremes of society; a position equally removed from insolence and meanness. The station to which it gives birth, not the degree of property possessed, the station I mean, in which it induces the man to place himself, is that, which principally renders this mean so valuable.

In these letters you may observe, that only a single style of building and living has been particularly commended; viz. that which is neat, tidy and convenient. This is a style always within the reach of those who possess the mediocrity in question. Where it prevails, I am assured, if my experience teaches me any thing, virtue in every form is much oftener found than with its opposites, vulgarism, grossness and dirt. Persons surrounded by these accompaniments may be sanctified, and therefore may be virtuous: yet, so far as I have observed, they are commonly exuberant sources of vice as well as of wretchedness, and are scarcely less hostile to virtue than to comfort.

I have mentioned that only a single style of building and living has been here recommended. Permit me to add, that I am still willing with Demosthenes to have public buildings assume a style superiour to this; and am not afraid of seeing them even splendid. Yet,

*Sit modus in rebus.*

At the head of Market-Street stands the mansion of the Hon. Stephen Van Rensselaer, late Lieutenant Governour of this State. Mr. Van Rensselaer is the eldest male heir of the first branch of the Rensselaer family, one of the most numerous and respectable in the former province of New-York, and among the most distinguished at the present time. The mansion house in which he resides struck my eye as exhibiting an appearance remarkably comporting with the fact, that, for a long period, it had been the residence of an ancient and distinguished family. The situation though not much elevated is fine, cheerful and prospective. It is the front of a noble interval in the township of Watervleit, containing seven hundred acres. East of this interval flows the Hudson; and, beyond it, is seen a handsome acclivity rising from its margin, upon which stands the neat, sprightly village of Bath. The house is large, and venerable, and looks as if it was the residence of respectability and worth. The hospitality which reigns here has ever been honourable to the successive proprietors.

At a small distance from this house Westward is the most extensive collection of manufactures which I have seen in the pos-

session of a single man. The proprietor is James Caldwell, Esq. In these works barley is hulled, peas are split, and hair powder, starch, snuff, tobacco, mustard, and chocolate, are manufactured. I visited them in the year 1792; and thought the manner of performing the business ingenious and happy. In 1794 they were burnt. The loss was estimated at \$37,000. Within eleven months they were rebuilt and ready for their respective operations. In these works forty boys find employment beside other workmen.

The trade of Albany is extensive. It consists in the exchange of foreign commodities for the produce of a large, fertile, country; and must, I think, continue to increase through a long period. Heretofore the inhabitants pursued a profitable commerce with the Indians, and were for many years still more profitably employed in the lucrative business of supplying successive armies with almost every thing which armies consume. Many of the inhabitants have of course become rich. This has been the fact particularly since the formation of the present American government.

I know not that Albany has ever suffered any serious evils from the savages.

I ought not to leave this town without paying a tribute of respect to the Hon. Philip Schuyler, major-general in the American army during the revolutionary war. This gentleman was born at Albany, in the year 1731, of an ancient and respectable family. In very early life he was distinguished for superiour talents, and an energy and activity almost singular. He was an officer in the army in the war which commenced at Lake George 1755. At an early period of life he became a member of the New-York Legislature; and was soon distinguished for his intelligence and influence. To him and Governour Clinton it was chiefly owing, that this province made an early and decided resistance to those British measures which terminated in the independence of the colonies. When the revolutionary war commenced he was appointed a major-general; and was always an active, useful officer wherever he was stationed. After the retreat of St. Clair from

Ticonderoga, he contributed largely to the defence of his country by his prudent and vigorous exertions. In the Senate of New-York he contributed probably more than any other man, to the code of laws adopted by this State. Of the Old Congress he was a useful member; of the New he was a Senator from its commencement, and was chosen a second time in 1797. He died at his own seat just below Albany, Nov. 18th, 1804.

In the year 1790, this city contained 3,498 inhabitants, in 1800, 5,387, in 1810, 9,356.

Wednesday, October 11, we rode from Albany to New-Lebanon; and lodged five miles below the spring; the distance being thirty-one miles. We arrived late; being prevented from commencing our journey by some necessary hindrances 'till 11 o'clock.

After crossing the ferry, we rode over a charming interval at Greenbush, handsomer and more fertile than any other, which I have seen on this river. It extends several miles towards the South; and is divided into beautiful farms, and planted, in a thin dispersion, with houses and out-buildings, whose appearance sufficiently indicates the easy circumstances of their proprietors. From the excellent gardens, which I have at times seen in this spot, and the congeniality of the soil to every hortulan production of this climate, I should naturally have believed, that the inhabitants, together with their neighbours, would have supplied the people of Albany with vegetables. Instead of this, they are principally furnished by the Shakers of New-Lebanon: a strong proof of the extreme reluctance, with which the Dutch farmers quit their ancient customs, even when allured by the prospects of superiour gain. The Shakers, I have been informed, obtain by gardening a revenue, not less than from five to seven hundred pounds, New-York currency, per annum.

From this interval we ascended the elevated grounds, by which it is bordered; and on the acclivity were presented with a very fine view of the city of Albany; the high lands North of it; the handsome seats in the neighbourhood; the river; and the pleasant intervals, by which for a great extent it is bordered on both sides. After we had ascended the hill, we found a long succes-

sion of gradual swells, resembling those between Stillwater and Schenectady : the soil a mixture of sand and clay, replenished every where with black, friable slate ; and the surface forested with oak, chesnut, pine, &c. This tract is tolerably fertile, and well suited to the growth of wheat. Within five or six miles of the river the country becomes gradually more and more hilly ; and the clay begins to be mixed with loam and gravel. Granite and limestone are found in considerable quantities ; and the forests become chiefly oak and chesnut. Our road, after leaving Greenbush, passes through Schodac, and Stephentown. The principal part of this County is the property of the Hon. Stephen Van Rensselaer, from whom it derives its name.

There is a small village in Schodac, containing about thirty houses ; and another in Stephentown, of perhaps twenty, standing on the border of Kinderhook creek, at the foot of a sprightly fall. The rest of this region is divided into farms, moderately fertile ; and cultivated by tenants. The houses, which they inhabit, are generally indifferent.

Schodac contained in 1790, —, in 1800, 3,788, in 1810, 3,166 inhabitants. Stephentown contained in 1790, 6,795, in 1800, 4,990, in 1810, 2,567 inhabitants.

I suppose Schodac, in the first census, to have been included in Stephentown.

The face of the country, after we left the vicinity of the Hudson, was no where very pleasant ; yet from two sources we derived not a little gratification. One of them was a succession of running waters, every where limpid and murmuring. These a New-England traveller would in ordinary cases scarcely notice ; as being objects so universally met with in his own country. But we had travelled before we came to Schenectady, one hundred and seventy miles, without finding more than two or three cheerful streams, beside the Hudson, and the Mohawk : the season having been very dry. To us, therefore, living springs, murmuring brooks, and noisy mill-streams, were delightful ; especially after crossing numerous channels, where water had once flowed ; but where it then lay in dirty puddles, and disgusted the traveller by

its loathsome effluvia. Nature seemed, here, animated anew. The earth, and the atmosphere, were charmingly freshened : and we finally lost the dull, heavy spirits, which we had derived from the melancholy grounds, opposite to Crown Point, and those which lie between that fortress and Sandyhill.

The other source of our gratification was the Catskill Mountains ; of which we had several very interesting views.

We passed through the principal part of New-Lebanon in the night. I shall describe it hereafter ; and am,

Sir, yours, &c.

## LETTER XVIII.

Richmond—West-Stockbridge—Salisbury—Cataract at that place—Sharon—Amenia—Washington.

*Dear Sir,*

We left New-Lebanon in the morning ; and pursued our journey through Richmond, West-Stockbridge, Barrington, and Sheffield, to the North-Eastern corner of Salisbury : thirty miles. That division of our road, which has not been described, was tolerably good. The only disagreeable part of it was the ascent of New-Lebanon mountain, a part of the Taghkannuc range ; which presents here a long, steep, and discouraging acclivity. At its foot, on the Eastern side, we entered Richmond, here the Western border of Massachusetts.

This township lies in a pleasant valley, bounded on the South by several small romantic mountains, separated by fine openings, beyond which ascends the lofty summit of Taghkannuc at the distance of twenty-five miles. Saddle Mountain, at the distance of almost twenty, bounds the view with a still superiour magnificence. West-Stockbridge, or, as it ought to be called, Richmond Mountain, terminates it on the East. The valley is universally under cultivation ; and the mountains are forested to their summits. The surface of the valley is a handsome scoop. The soil is rich ; the meadows and pastures are covered with a fine verdure, and the whole scene is ornamented with clumps of trees, prettily set in different parts of the expansion.

The houses in Richmond are principally built on the road, termed the Street, and running from North to South four or five miles. They are good farmers' dwellings. The church is a pretty building : and every thing around it wears the appearance of prosperity. Iron ore is found here in various places.

Richmond, in 1790, contained 1,255 inhabitants ; in 1800, 1,044 ; and, in 1810, 1,041 : included in a single Congregation. In the first of these enumerations I suspect there is an error.

West-Stockbridge is a rough township on the side of the Tagh-kannuc range and a collection of rude hills connected with it on the East. The soil is principally fit for grazing. The base of these hills is to a great extent marble both white and parti-coloured principally with blue. The colour of the white is remarkably beautiful and little inferior in purity to that of snow. I have seen many specimens of white marble from Italy, but both are less white than that which is found here. They are however more beautiful, as being of a much finer texture. Great quantities of this stone are wrought here, and exported.

The number of inhabitants in West-Stockbridge was, in 1790, 1,113; in 1800, 1,002; and, in 1810, 1,049.

Salisbury is the North-Western township in the County of Litchfield, and of the State of Connecticut. The surface is hilly and pleasant; the soil rich; and the produce abundant. It is excellent land for wheat as well as for grass.

This township contains an immense body of the richest iron ore, and a furnace and forges in which it is cast and wrought. The metal is probably more tenacious than any other hitherto known. Cannon formed of it and of the same weight and caliber with brass cannon, were some time since proved, in the presence of the late Gen. Hamilton, and found to possess all the requisite strength.

Salisbury includes two Congregations, a Presbyterian and an Episcopal; and contained, in 1756, 1,100; in 1774, 1,936; in 1800, 2,266; and, in 1810, 2,321 inhabitants.

Friday morning, October 12th, we proceeded to Sharon. Our road soon rejoined the Hoestennuc: which here bends about three miles Westward. The ride was delightful.

Five miles from the place where we lodged, we saw a magnificent cataract in this river. About seventy rods higher up, a rift of rocks, twenty feet in height, crosses the stream, which pours over it in a perpendicular sheet. At one third of the distance from this fall towards the cataract rise two large rocks in the channel, each inclining toward the other in a manner fantastical and singular. At some distance below them a dam is erected ob-

liquely across the river to accommodate a suit of mills and other water-works. A second and very handsome sheet descends from this dam.

The cataract is the next object in the train; and is formed by a vast ledge of limestone, crossing the river obliquely from the North-West to the South-East. The length of this ledge is about thirty-five rods, its perpendicular height sixty feet, its front irregular, broken, and hanging with a wild magnificence.

Here, in a stupendous mass on the Western side, and on the Eastern in every form and quantity of descending water, from the furious torrent, to the elegant cascade, this noble stream rushes with astonishing grandeur, and the most exquisite beauty. The beauty is unrivalled by any cataract which I have seen, except at Glen's falls, and the force, when the river is full, except by those of Niagara. On the ridge there are three small elevations. The Westernmost of these contains earth enough to nourish three considerable trees, and each of the others to sustain one. Nothing can be more picturesque than these objects in this place.

The mass of foam at the bottom, you will easily believe, is in the highest degree tumultuous and majestic. A mist rises from it, in greater quantities, and finer forms, than I have ever seen, except at Niagara.

In the year 1792, I was here in the month of May, when the river was full. At that time, both complete, and imperfect rainbowed circles of coloured light ascended slowly from the surface in a continued succession, and gradually floated away on the bosom of a white, misty cloud, which filled the bed of the river. In our present journey the sun was covered with clouds, and prevented us from seeing this splendid object.

Below the cataract, the water descends with a hasty current about forty rods, and there falls a third time over another rift ten feet. Here two islands unite the three divisions of a second dam, which furnishes the fifth sheet within this little distance. Still further down, the river is uniformly a hurrying rapid for fifty or sixty rods, foaming beautifully over a rocky bed and making a regular cadence to the different falls. The whole descent is

about one hundred and thirty feet nobly arranged and distributed, and comprehending a remarkable variety of beauty and grandeur.

In the year 1780, being at Salisbury upon a journey of business, I stumbled upon this spot by mere accident; having never before heard that such a cataract existed. When my friend, Doctor Morse, was about publishing his *American Geography*, I mentioned it to him; and found, that after all his laborious enquiries concerning the United States, he had never heard of it before. This is one among the innumerable specimens of the want of curiosity of my countrymen with respect to interesting objects around them. Half a million of the New-England people were, perhaps, well-acquainted with the existence of the Cohoes, a scene far inferiour, and scarcely half a thousand, except the people in this vicinity, knew that the Salisbury cataract existed. You will easily believe that we left this spot with reluctance in order to proceed on our journey to Sharon. The distance is ten miles; the direction South-West; the surface undulating; the soil good; and the country divided into a succession of farms.

Sharon lies immediately South of Salisbury; and is bounded on the West by Amenia in the State of New-York. Cornwall bounds it on the East, and Kent on the South. The township contains two parishes; the Town, and the East parish. The town is principally built on a single street, perhaps four miles in length. At the two ends the houses are scattered; in the centre they form a handsome village. The street lies along the Western declivity of a mountain of moderate height, rising in the middle of the township, and running through a considerable part of it from North to South. The declivity is gradual and handsome, descending about a mile towards the West. The prospect in that direction, and towards the North and South, is made up of a beautiful interchange of hills and vallies; on the North, formed of the points of several romantic eminences, with beautiful openings between them; and toward the South-West, expanding without limits. The hills are all crowned with fine forests, and thrifty groves; and in the vallies, run several sprightly streams, bordered with intervals. The soil of Sharon is excellent; being the reddish loam formerly mentioned. Lime-

stone abounds here ; and probably marble also, although it has hitherto escaped attention. The produce of both Sharon and Salisbury is transported to Poughkeepsie, where it is embarked on the Hudson for New-York.

In the year 1796 the tooth of a mammoth, found in the North-Western corner of this town, was transmitted to me by the Hon. John Cotton Smith, and deposited in the museum of Yale College. It was dug up in a swamp by some men who were employed in collecting vegetable mold for manure. The roots of the tooth, were much decayed, and, after being exposed to the air, chiefly crumbled into dust. The remainder was in a state of tolerable preservation. Since it was lodged in the museum it has decayed still more. This is the only relic of the mammoth, which, within my knowledge, has been found in New-England.

Sharon includes two Congregations ; and contained, in 1756, 1,205 inhabitants ; blacks 7 : in 1774, 2,006 ; blacks 26 : in 1800, 2,340 ; and, in 1810, 2,606.

Monday, October 12th, I rode, in company with the Rev. Mr. S. of Sharon, through Amenia and Kent to Washington : nineteen miles. After descending the declivity on which Sharon is built, the road winds through a beautiful valley in Amenia, finely cultivated, fertile, and settled by a collection of thrifty farmers. The valley is watered by a mill-stream, called the Oblong River, a branch of the Hooestennuc ; which, rising in the Southern part of Salisbury, unites with that river in the Northern part of New-Milford.

Amenia contains a part of a tract of land, ceded by the Colony of Connecticut to the Province of New-York, to quiet the claims of that Province upon Greenwich, Stamford, and Norwalk. This tract is, here, about a mile and a half wide ; and extends from the Northern boundary of Norwalk to the Northern boundary of the State ; and contains sixty thousand acres. This tract is known by the name of the Oblong.

Amenia contained, in 1790, 3,078 inhabitants ; in 1800, 2,978 ; and, in 1810, 3,073.

The second division of the road commenced five miles from Sharon; and passed through a defile, remarkably disagreeable, and resembling not a little that, which lies between Manchester and Clarendon. Like that it is bordered by rough, ill-looking hills, and a dismal swamp at the bottom. The inhabitants are poor, and look as if they were forsaken by mankind. A great part of this tract is also in the Oblong.

After travelling seven or eight miles we came at once into a charming vale, declining towards the South-East, with a murmuring mill-stream at the bottom, lined with intervals rich, and verdant. The Northern end of this valley is terminated by the declivity of two mountains, which here unite angularly, and shelter it from every wind, which does not blow from the South. It looks as if it was the retreat of the mild seasons only. Every thing has the aspect of thrift and peace; and silence reigns in the midst of plenty. I know not where absolute retirement could be found with more inviting circumstances. From this spot the road passes through the Scaghticoke settlement formed by the remains of an Indian tribe of that name. The tract which they occupy is a handsome interval about three miles in length, on the Western border of the Hooestennuc. On the West it is bounded by the base of a lofty mountain. The land, naturally excellent, is miserably cultivated, both by the Indians and their tenants. Few spots are more romantic. The river a fine stream; the interval an elegant piece of ground; the mountain, high, ragged and precipitous, and in wet seasons ornamented with several cascades stealing down its rough sides; form an interesting group in this wild solitude. To these objects very affecting and melancholy additions were made by the weckwams sixteen in number, by the degraded appearance of their women and children, and by the recollection of those particulars in their whole state of society which these objects forced upon the mind. They were Indians; but I could not forget that they were human beings; neither could I fail to look forward with a painful conviction, that they and their descendants will probably continue just such as they now are until their race and their name shall be extinguished.

We dined at a place called Bull's Ironworks. From this spot our road began to ascend the Green Mountain range. It was rough and neglected, passing through a tract of indifferent land thinly settled by inhabitants, whose enjoyments appeared to be few, and whose hopes must be faint and unpromising. The summits of these hills present a better aspect, and form a part of the North parish of Washington.

This township is principally composed of high, rough hills. It is however good grazing land. The inhabitants are in very comfortable circumstances, and sustain a good character.

Washington contained, in 1790, 1,675 inhabitants; in 1800, 1,568; and, in 1810, 1,575.

In the morning, October 16, we rode to Litchfield. The next day I reached New-Haven without any accident.

I am, Sir, yours, &c.

# JOURNEY TO PROVINCE TOWN.

## LETTER I.

East-Haven—Branford—Guilford—Its burying-ground—White fish used as a manure—Killingworth—Saybrook—Its settlement and fortress—Lady Fenwick's monument.

*Dear Sir,*

WEDNESDAY, September 17th, 1800, I set out in company with Messrs. D—— and H——, alumni of Yale College, upon a journey to Cape Cod. On this day we rode to Saybrook, through East-Haven, Branford, Guilford, and Killingworth: thirty-four miles.

The road during the whole of this journey, until we arrived at Canonicut ferry, is alternately smooth and rough.

The hills in New-England, you will remember, are generally ridges, commencing on or near the sound, and running into the interior in a North-Easterly direction. At times the road passes between the sound, and the commencement of these hills. The surface is, here, level, free from stone, beautiful, and pleasant. The road, unless neglected, is, of course, always good. At other times it crosses the hills; which are sufficiently high, steep, numerous, and stony, to be very disagreeable. This is particularly the case between Connecticut river, and the Eastern boundary of the State. As some compensation for these inconveniences, the hills frequently present noble and delightful prospects.

East-Haven, originally a parish of New-Haven, is bounded by the Quinipiac and New-Haven harbour on the West, North-Haven on the North, and Branford on the East. The sound is the Southern boundary of all the townships, through which we passed in this journey, until we arrived at Sandwich.

East-Haven is an alternation of hills, vallies, and plains; neither of them very fertile. unless under skilful cultivation. With

such cultivation they are capable of producing the best crops. Barley, particularly, flourishes on these grounds. All the townships, mentioned in this day's journey, yield, easily, every production of the climate. The forests also, until we crossed the Eastern line of the State, we found every where to be oak, hickory, chesnut, &c.

Several of the hills, on the North side of this road, exhibit a singular appearance. They are the ends of the ranges, mentioned above; terminating on the Northern side of the road. In form they are rough, misshapen, sugar-loaves of whin-stone, steep, and ragged. On their sides, and at their bases, great masses of this stone are thrown together in confusion. Its texture, and colour, are substantially the same with those of the basaltic columns, which form the Giant's causeway.

Free stone, of a good quality, is found in this township, in inexhaustible quantities.

The inhabitants have an ample market for all their produce at New-Haven.

In the Quinipiac, near its mouth, is a very large and most prolific bed of oysters. These shell fish are annually caught, between the months of September and May, in vast quantities. Many of them are opened, and put into casks; and sent, during the cold season, over large tracts in Connecticut, New-York, Massachusetts, Vermont, and New-Hampshire. As women and children are extensively employed in opening them, the expense of this fishery, which is quite profitable to the inhabitants, is inconsiderable. With these advantages, united with a little commerce, the inhabitants are in prosperous circumstances.

The houses in East-Haven are generally good farmers' dwellings. It contains two churches; a Presbyterian, and an Episcopal. The Presbyterian church is a valuable structure, built of the free-stone mentioned above. The steeple was blown down October 10th, 1797, by the tornado, noticed in the account of Portland; but was soon rebuilt. The Episcopal congregation is small, and is connected with two others in Branford, and Guilford.

East-Haven, in 1790, contained 1,025 inhabitants ; in 1800, 1,004 ; and, in 1810, 1,209.

Branford, which is composed of hills and vallies, is a considerable township, containing the parishes of Branford, and North-Branford, and the principal part of Northford. Bluff-Head, a considerable mountain, lies partly in this township, and partly in that of Guilford. Pumice-stones, found at its foot, have persuaded several persons, that it was anciently a volcano.

Branford was purchased by the New-Haven Colonists, December 11th, 1638 ; seventeen days after they had bought New-Haven ; of Momauguin, Sachem of Quinipiac, and his people, professedly the sole proprietors of the land. A powerful inducement, mentioned by themselves in the treaty, in which they conveyed them to the English, was the heavy taxes,\* levied upon them by the Pequods, and Mohawks. Another, more forcible still, was their continual dread of these formidable nations ; who had frequently driven them from their country, and had reduced them to the number of forty fighting men. The English, therefore, were received by Momauguin, as their countrymen at Plymouth had before been by Massasoit, from the hope of finding in them allies, who might protect them from the inroads of their neighbours. In this hope they were not, in either case, disappointed. There is no record of any contention between the English, and these Indians ; nor does it appear, that, after the settlement of New-Haven, they were ever disturbed by their countrymen. The Northern part of these townships was, however, purchased of Montowese, Sachem of Mattabesec.†

The soil of Branford is strong, but cold. When quickened with manure, it yields rich crops.

Within the last twenty years the inhabitants of this, and other townships along the coast, have employed for the purposes of manure the white-fish : a species of herring remarkably fat, and so full of bones, that it cannot conveniently be eaten. In the months of June, and July, these fish frequent the sound in shoals ;

\* Indian taxes were paid in wampum and skins.

† Middletown.

and are caught with seines, in immense multitudes. Ten thousand are considered as a rich dressing for an acre. No manure fertilizes ground in an equal degree ; and none seems more universally favourable to the productions of the climate. Wheat, particularly, grows under its influence in the most prolific manner ; and is peculiarly safe from blasting.

The town of Branford is destitute of beauty. The situation is unpleasant ; and the houses are chiefly ancient, and ordinary. There are five congregations within the township : four Presbyterian, and one Episcopal. The Episcopal church is small, and without a steeple.

The inhabitants are principally farmers ; sober, industrious, orderly citizens ; not remarkable for energy ; and, like those of East-Haven, less attentive than most of their countrymen to the education of their children. A considerable number of them are seamen, and are principally employed by the merchants of New-Haven.

Branford appears as if it had already arrived at a stand in the progress of improvement, and had become fixed in its present state by the mere want of energy and effort. In the year 1756 this township contained 1,700 inhabitants ; blacks, 106 ; in 1774, 2,051 : blacks, 113 ; in 1790, 2,267 ; in 1800, 2,156 : blacks, 67 ; and, in 1810 ; 1,932.

Guilford lies immediately East of Branford. The surface is generally similar. The soil in the interior is also the same. On the sound, particularly in the first parish, it is remarkably rich. I know of no land more productive.

There are two marshes in this town, which at times have produced among the inhabitants, in their neighbourhood, the fever and ague : on the Eastern side of the Green Mountains, a singularity.

In the year 1796, the inhabitants removed a large body of shells from the beach, lying on the South-East, for the purpose of manuring their fields. In this manner they lowered the surface of the beach to such a degree, that in spring tides the waters of the sound broke over it, and flooded a tract of salt-marsh, lying be-

tween it and the town. Here they were stagnant, and soon became offensive. The inhabitants were distressed in great numbers with the bilious remittent, and dysentery. In the year 1800 they drained the marsh, early in the summer. The fish, with which the waters had become replenished, died. The bilious remittent again spread over the whole neighbourhood. In one instance, only, has it been fatal; yet it has been very distressing in many. If the work has been effectually executed, it is probable, that hereafter the sickness, so far as it has been derived from this source, will be prevented.\*

The town of Guilford is compactly built. Like those of Branford, the houses are in many instances ancient, and ordinary. There are a few exceptions. In the centre is an open square. Two churches, a Presbyterian and an Episcopal, stand on it, together with four school-houses; in which are kept four very good schools. The Episcopal church is without a steeple. This square, like that in New-Haven, is deformed by a burying-ground; and, to add to the deformity, is uninclosed. The graves are therefore trampled upon, and the monuments injured, both by men, and cattle.

The design of locating places of burial in this manner was probably good. In its execution, however, it evidently defeats itself; while it is also a plain violation of propriety. Instead of producing those solemn thoughts, and encouraging those moral propensities, which it was intended to inspire, it renders death and the grave such familiar objects to the eye, as to prevent them from awakening any serious regard. Here, particularly, both the remains, and the memorials, of the dead are presented to the mind in circumstances so gross, and indicative of so little respect in the living, as to eradicate every emotion, naturally excited by the remembrance of the deceased; and give to those, which remain, a coarseness, and commonness, destructive of all moral influence. Nor is it unreasonable to suppose, that the proximity of these sepulchral fields to human habitations is injurious to health. Some of them have, I believe, been found to be offensive, and

\* This conjecture has been verified during the ten years past. (1811.)

will probably be allowed to have been noxious. Even in cases where nothing of this nature is perceptible, it is far from being clear, that effluvia, too subtle to become an object of sense, do not ascend in sufficient quantities to affect with disease, or at least with a predisposition to disease, those, who, by living in the neighbourhood, are continually breathing this mischievous exhalation.\*

The township of Guilford contains four parishes, and five congregations.

The people have retained, more than most others in this State, the ancient manners of the New-England colonists. Parents are regarded by their children with a peculiar respect; derived not only from their domestic government and personal character, but also in a considerable degree from the general state of manners. Old people are in a similar degree revered by the young; and laws, and magistrates, by the inhabitants at large. Private contentions have heretofore been rarely known; and law suits so rare, that no lawyer, until lately, has ever been able to acquire a living in this town. The weight of public opinion has been strongly felt; and diffused a general dread of vice. In these convulsive times, efforts have been made to disturb this happy state of society; yet, although aided by some untoward incidents, they have been attended with less success, than was rationally to have been expected.

There are two harbours in this township; Guilford harbour, and Sachem's Head. The latter is the ship harbour; and received this denomination, in the year 1637, from the following fact. Two Pequod Sachems, after the defeat of that tribe by Captain Mason, were taken by the troops under Captain Stone; and had their lives spared, upon promising to discover the place, to which their countrymen had fled. The English brought them to this place; and, finding that they obstinately refused to give the stipulated information, beheaded them.† By these harbours

\* A few years after the writer passed through Guilford, the burying-ground, in the centre of the town, was enclosed by a decent and substantial fence.—*Pub.*

† The Rev. Mr. Ruggles, in his manuscript history of Guilford, gives a different account of this subject. He says, that after the Pequods were driven from their

the inhabitants carry on a considerable commerce. A large quantity of wood is annually shipped here both for New-York and New-Haven; and a number of vessels annually built; most of which are purchased by the New-Haven merchants.

Guilford is an ancient settlement. Its Indian name was Menuncatuc. It was purchased of the Indians in 1639. The first settlers, about forty in number, were natives of Kent, and Surrey, in England; and were induced to pitch upon this spot, from its resemblance to the region of their nativity.

In the skirts of Guilford there are several beautiful views; particularly one, at the house lately belonging to one Joseph Pynchon, Esq.\*

The soil of East-Guilford is naturally less rich than that, on which the town is built; but, being extensively manured with white-fish, yields abundant crops. These fish are sometimes laid in furrows, and covered with the plough. Sometimes they are laid singly on the hills of maize, and covered with the hoe. At other times they are collected in heaps, formed with other materials into a compost; carted upon the ground; and spread in the same manner, as manure from the stable. A single net has taken 200,000 in a day. They are sold for a dollar a thousand; and are said to affect the soil advantageously for a considerable

country, they fled Westward. A party of the English pursued them, accompanied by Uncas and his followers. When they had arrived at Sachem's Head, they discovered a Pequod chief with a few attendants. Uncas and his Indians gave them chase. The Pequods, hoping to escape their enemies, fled to the long narrow point, which is the Southern boundary of this harbour. Uncas ordered some of his men to scour the point. The Pequods, finding themselves in danger, swam across the mouth of the harbour, and were taken prisoners immediately after they reached the shore. The Chief was then condemned to die. Uncas shot him with an arrow; cut off his head, and placed it in the fork of a large oak tree near the harbour.

*Mass. Hist. Coll. Vol. 10, p. 100.*

\* This house was built by the Rev. Henry Whitefield, who led his congregation from England to Guilford. After continuing with them, according to tradition, about twelve years, he returned to England. Major Thompson purchased his estate, and transmitted it to his heirs. The house is probably one of the most ancient in Connecticut. It was built of stone, and is now in a state of tolerable preservation; and is perhaps equal in value to any other private building in the township.

length of time. The people of East-Guilford are not a little indebted to them for their present prosperity.

One very disagreeable circumstance attends this mode of husbandry. At the season, when the white-fish are caught in the greatest quantities, an almost intolerable fetor fills the surrounding atmosphere; and, however use may have reconciled to it the senses of the inhabitants, it is extremely disgusting to a traveller.

Guilford, in 1756, contained 2,322 inhabitants: 59 blacks; in 1774, 2,930: 84 blacks; in 1790, 3,460; in 1800, 3,602: 55 blacks: and, in 1810, 3,845.

Killingworth is a pretty town, situated on a fine slope, declining almost imperceptibly from the foot of the hills to the sound. The soil is good;\* the surface handsome: and the prospects are very gratifying to the traveller. A small stream, running through it, terminates in a harbour at the sound. Here the inhabitants build annually a few vessels, and carry on a limited commerce. The town is principally built on a single street, about a mile in length, and many of the houses make a decent appearance.

Its Indian name was Hammonassit. Its English name was Kenelworth; but, having been recorded Killingworth by mistake, it has retained this appellation to the present day.

This township includes two parishes. In 1756, it contained 1,458 inhabitants: blacks 16; in 1774, 1,990: blacks 33; in 1790, 2,156; in 1800, 2,049: blacks 14; and, in 1810, 2,244.

Westbrook is a parish of Saybrook, bordering on Killingworth. The surface is hilly, and in several places pleasant. The soil is good: and the whole tract a collection of farms. The inhabitants are sober, industrious, and in comfortable circumstances. Ship-building is carried on here also.

Saybrook is bounded on the East by Connecticut river, on the South by the sound, on the West by Killingworth, and on the

\* The following is a strong instance of the fertility of land, manured with white-fish. Mr. David Dibble of this town, from five and a half acres of land, dressed with this manure, had in the year 1812, 244½ bushels of rye, almost forty-five bushels to an acre: the most exuberant crop of this grain which I have known in New-England.

North by Haddam. It contains four parishes; those already mentioned, North-Saybrook and Chester. The hills here terminate about a mile and a half from the sound, and leave a beautiful plain, on which the town is chiefly built. The principal street is about a mile in length, lying nearly parallel with the Sound. Several of the houses are neat, a considerable number are ancient, and ordinary. The soil of the hills and vallies is generally good; and that of the plain excellent, easily cultivated, and productive of all the grains, and fruits, of the climate.

The inhabitants retain most of their original character; and are proverbially distinguished in the country around them for their peace and good neighbourhood. Decency, good order, and quiet, have, with little interruption, prevailed, from the original settlement. At the same time, they exhibit proofs of moderate industry, and contentment, rather than of vigorous enterprise. This part of Saybrook has, I suspect, increased very little within the last thirty or forty years. The additional numbers become colonists; and emigrate to the North and the West. No considerable attempts appear to have been made in mechanical or manufacturing business. The commerce, which is of long standing, has been somewhat increased by the efforts of a single man; but is now at a stand. The agriculture has probably been unaltered for thirty years. The circumstances of the inhabitants, however, appear generally to be comfortable.

Saybrook has been commonly, but erroneously, considered as the most ancient settlement in Connecticut. The first European house in the State was built at Hartford, by the Dutch, in 1633, and called the *Hirse of Good Hope*. The second was built a few weeks afterwards in Windsor, by William Holmes of Plymouth.

On the 29th of October, 1635, a colony from Dorchester in Massachusetts planted themselves in Windsor. Two other colonies about the same time, began the settlement of Hartford and Wethersfield. About the middle of the following November, a company, sent by John Winthrop, Esq. with arms and other necessaries came to Saybrook; threw up some slight works; and mounted two pieces of cannon. A few days after, a Dutch ves-

sel came into the mouth of the river for the same purpose; but the people were prevented from landing by the cannon of the English. Under the auspices of Mr. Winthrop, the settlement of Saybrook was continued, and advanced; and by the aid of David Gardner a regular fort was erected, of sufficient strength to defend the planters against every probable invasion by land or water. In the year 1639, George Fenwick, Esq. one of the patentees of Connecticut, and a man distinguished for his piety and good sense, was sent out by his associates to superintend their interests. Under his direction the settlement prospered. His wife, Lady Fenwick, died, and was buried, here. Mr. Fenwick, after her death, returned to England.

Thursday morning, the 18th, we rode out in company with the Rev. Mr. H. of Saybrook, to see a field, from which the surface had been blown away, in a manner uncommon in this country, and supposed by the inhabitants to be singular. A discreet man, who lived in the neighbourhood, informed us, that, about forty years since, the soil, on a little spot in the interior of the field, was blown off; and that the sand, which lay beneath it, and which was very fine and light, was then blown out, so as to form a small cavity. Hence the ravage extended in every direction, until about twenty acres were uncovered to the depth of from one to three feet.

We found here a number of Indian arrow-heads; and concluded from this fact, that the ground had formerly been the seat of an Indian village.

Hence we proceeded to Saybrook point, three fourths of a mile below the church. Here, on a rising ground of considerable height, jutting into the river, and united to the main by a beach, and a salt marsh which borders it on both sides, the company sent by Mr. Winthrop in 1635, threw up their temporary works; and planted the cannon, with which they drove away the Dutch intruders. On the same spot Mr. Winthrop afterwards erected a permanent fortification. The ground was well chosen. The hill is steep; inaccessible, but by means of the beach already mentioned; not commanded by any other ground; and possessed

of an immediate communication with the river. To Indian assailants it was impregnable; and for a considerable time might have resisted with success any supposable invaders.

In 1647, the combustible parts of this fortress were burnt by accident. In the revolutionary war, a fort of the same dimensions was erected on the same spot, to prevent British privateers from entering the river. For this purpose it was perfectly fitted; as the channel lies almost under the mouths of its cannon. Since the peace of 1783, these works have been suffered to decay. A part of the wall of the ancient fort is still visible; as are also the ruins of a well, dug within, to furnish water for the garrison. We saw several of the cannon, brought hither by Mr. Winthrop. In the revolutionary war they were mounted; and found to be perfectly serviceable, although they had lain on the spot one hundred and forty years.

From this place we proceeded to the monument of Lady Fenwick; which stands in a field, beyond the marsh mentioned above, South-Westward from the fort. It is built of brown free-stone; and is of a structure, which in this country is, I believe, singular. Its length is between five and six feet; its breadth about three; and its height about two and a half. The sides, and ends, were originally plain slabs, handsomely cut, and smoothed. The top-stone resembles the figure of a scroll pediment; but without an opening.

This monument has unfortunately, and very improperly, been suffered to go to decay. It is said, that provision was made by Colonel Fenwick for keeping it perpetually in repair. If such a design was formed, it has never been carried into execution. If any of the descendants of this respectable woman remain, they might do equal honour to her, and themselves, by securing it from future injuries.

The sand-stone, of which it is built, is of so perishable a nature, that the inscription has been obliterated, beyond the remembrance of the oldest existing inhabitants.

On the Western side of this point sets up a cove, which separates it from Lynde's Point. In high tides the water overflows the

neck, which, at the distance of about a mile from the fort, connects Saybrook Point with the main. Here, a palisado was anciently formed, from the river to the cove, to secure Saybrook Point from any sudden incursion of the Indians.

About half way between the palisado and the fort, was erected the first building, designed for the Collegiate school, since named Yale College. It stood on the Western side of the road, in a situation extremely pleasant; was one story in height, and about eighty feet in length. The ruins of the cellar are still visible.

Here the town of Saybrook was originally built; and few places are pleasanter. From the fort particularly, which is perhaps the best point of view, the prospect of the river, of Lyme on its Eastern shore, of Griswold's and Lynde's Points, which form its mouth, the opposite shore of Long-Island, the plain of Saybrook, and the hills beyond, is uncommonly attractive.

Lynde's Point is an estate of great value, belonging to a gentleman of that name. The surface is beautiful; and the soil rich. It is also nearly surrounded by water; and therefore freed from the expense of an artificial enclosure. These waters furnish the most convenient accommodations for the transportation of its produce to market; perfectly secure it from intrusion, and trespass; and bring annually a very lucrative fishery to its shores. Very few landed estates in this country are equally productive, or equally pleasing to the eye.

Saybrook contained, in 1756, 1,931 inhabitants: blacks 33: in 1774, 2,687: blacks 59; in 1790, 3,233; in 1800, 3,363: blacks 62; and, in 1810, 3,996.

I am, Sir, yours, &c.

## LETTER II.

Lyme—New-London—Invasion and burning of New-London and Groton by Arnold and Eyre—Murder of Colonel Ledyard.

*Dear Sir,*

AFTER dinner, we crossed the Connecticut, here a mile in breadth ; and rode through Lyme to New-London : twenty miles.

Lyme, as I have already mentioned, is opposite to Saybrook. Like Saybrook, it is composed of a plain, bordering Connecticut river, and terminating on the Sound ; and of a collection of hills. The plain is about a mile in breadth, fertile, and pleasant. The hills are rude and rocky. The town is principally built on a single street, lying upon the former of these grounds, and parallel with the river. The houses generally resemble those of Saybrook. The church stands in a bleak and solitary spot, on the acclivity of the hill which is nearest the river. From the summit of this hill there is a fine view of the delightful objects, mentioned in the account of Saybrook.

From this place the ridges, which here, in a continual succession, extend themselves to the borders of the Sound, render the travelling very disagreeable. They are steep ; rough ; covered with a cold and lean soil ; unpleasant to the eye ; and inhabited by farmers, occupying houses, and farms, generally indicative of little prosperity. A considerable part of this region is still forested. The road, however, has been repaired, and smoothed, with no small labour, in a manner deserving much commendation. It has been improved also, by the erection of a good bridge over Nahantic bay, an arm of the sea, formed by a small river of that name. Here a ferry was formerly kept, called the Rope ferry ; which at times was troublesome and dangerous. The bridge is straight, built on wooden piers, planked, and neatly finished ; and was the first bridge in this State, authorized by law to collect toll from passengers.

From Nahantic river, four miles Westward, a tract, extending from the Sound to the Northern boundary of Lyme and New-London, was reserved for the Indians, when these townships were incorporated. Some time afterward, the inhabitants of both united in a petition to the Legislature to include these lands within their limits. The Legislature granted the petition, without determining upon the dividing line. New-London proposed to take three miles in breadth, and leave one to Lyme. Lyme made a similar proposal to New-London. The distance to the seat of government was fifty miles. The journey lay through a wilderness inhabited by savages, and crossed by numerous streams, over which no bridges were erected. The land, though now of considerable value, was then regarded as a trifling object. The expense of appointing agents, to manage the cause before the Legislature, was considerable; and the hazard of the journey was not small. In this situation the inhabitants of both townships agreed to settle their respective titles to the land in controversy by a combat between two champions, to be chosen by each for that purpose. New-London selected two men of the names of Picket, and Latimer: Lyme committed its cause to two others, named Griswold, and Ely. On a day, mutually appointed, the champions appeared in the field; and fought with their fists, 'till victory declared in favour of each of the Lyme combatants. Lyme then quietly took possession of the controverted tract; and has held it, undisputed, to the present day. This, it is presumed, is the only instance, in which a public controversy has been decided in New-England by pugilism.

The Indians, for whom this territory was reserved, are now reduced to about thirty persons; and have a tract of four hundred acres, secured for their maintenance by the State.

The settlement of Lyme commenced in 1664. Its Indian name was Nahantic. Originally it was a part of Saybrook; and its first English name was East Saybrook. In 1667 it was incorporated by the name of Lyme; and contains four parishes, and five Congregations; three of Presbyterians, one of Independents, and another of Baptists. The inhabitants, in 1756, amounted to

2,956 : of whom 100 were blacks, and 94 were Indians ; in 1774, to 4,088 : blacks 124 ; Indians 104 ; in 1800, they were 4,380 : of whom 23 were slaves, and about 30 were Indians ; and, in 1810, 4,321.

His Excellency, Matthew Griswold, formerly Governour of Connecticut, was an inhabitant of Lyme. This gentleman, who was born March 25th, 1714, devoted himself in early life to the study of law, and became distinguished in his profession. He was successively a Representative in the Legislature, a Councillour, Judge of the Superiour Court, Chief Justice, Lieutenant-Governour, and Governour ; and was deservedly held in high estimation for all the prominent excellencies of the human character. His understanding was vigorous ; his integrity the object of universal and absolute confidence ; and his piety eminent and undoubted. He died April 28th, 1799.

The road from the Rope ferry to New-London passes over a country, somewhat less uneven, and unpleasant, than that, which was last described. It is, however, neither fertile nor beautiful.

Since this account was originally written, I have been informed, that the region between Lyme and New-London has, by some late efforts, been shewn to be capable of becoming fertile. A more skilful husbandry has been employed on several parts of it with much success ; and may not improbably change its whole face.

We continued in New-London 'till the following afternoon ; and spent our time very pleasantly. At five o'clock we crossed the Thames and rode through Groton to Stonington : sixteen miles. The road crosses without intermission hills and vallies, rougher and more uncomfortable than those already mentioned ; and, notwithstanding a great deal of labour, commendably bestowed on it, is very disagreeable.

New-London is situated on a declivity, upon the Eastern side of the Thames. This river is about two thirds of a mile wide ; and forms a harbour of great capacity, and depth. Vessels of almost any size find in it sufficient water, and good anchoring ground. It is also perfectly safe. The centre of the town is about

three miles from its mouth. The site is pleasant; but would be handsomer, if less encumbered with rocks.

The principal streets are parallel with the river; and are crossed by others nearly at right-angles; but without any regularity, either in their distances or their direction.

The houses are less beautiful, less thoroughly repaired, and in fewer instances painted, than a stranger would naturally expect. It is said, that rents are high, and that every house is inhabited. There are two churches here; a Presbyterian, and an Episcopal. The former is a handsome building. There is also a small Congregation of Baptists. New-London is a shire-town; and gives its name to the County. The Court-house is an indifferent building, unfinished, and apparently left to the disposal of the weather.

The fish market is believed to be the best, except that of Newport, in the United States. A considerable part of the fish, sold in New-York, are supplied by the fishermen of New-London, from the waters in its neighbourhood.

The commerce of this town was formerly very considerable. Since the Revolutionary war, the enterprising spirit of the inhabitants appears sensibly to have declined.

There are two banks in New-London: one more, it is believed, than is necessary, or useful.

The government of New-London is vested in a Mayor, Aldermen, and Common Council. The Thames is navigable, about sixteen miles, for schooners and sloops; and about eight for frigates.

A considerable number of enlightened and polished families have always resided in this city.

In the year 1781 a body of British troops embarked from Long-Island, under the command of Gen. Arnold, on the night preceding the sixth of September; and, having crossed the sound, landed at ten o'clock the next morning, in two detachments, on the two shores of the Thames, near its mouth. The detachment, which landed on the Groton shore, was commanded by Colonel Eyre; the other by Arnold himself. Fort Trumbull, a small and imperfect work, built for the defence of the Thames, about

a mile below New-London, was evacuated at the approach of the British : the little garrison, stationed in it, crossing the river to Fort Griswold, erected on the Groton side, and immediately opposite to New-London. Arnold marched to the town without any material resistance : there being no body to oppose him, except a few straggling inhabitants, who fired now and then at his troops, as they were advancing. Col. Eyre at the same time moved on his corps to attack Fort Griswold, defended at that time by above one hundred and fifty militia ; hastily collected (some of them without arms) for this purpose. As the British drew near the fort, a firing commenced with great resolution ; and was maintained with the utmost spirit, under the command of the gallant Col. Ledyard, for a considerable time. Eyre was soon wounded ; and Major Montgomery, the second in command, killed. Major Broomfield, the officer next in rank, conducted the remainder of the enterprise. The British were severely handled ; and, though greatly superiour in numbers, and in every military advantage, except bravery, are said to have doubted for a time whether to continue, or relinquish the assault. The fort, originally imperfect, had been neglected ; and had materially gone to decay. Still the action lasted forty minutes : when the assailants carried the works by the bayonet. The resistance instantly terminated. The British leader, upon entering the fort, asked who commanded. The brave Ledyard, who by his defence had merited the highest respect from every military, and particularly from every generous, man, answered, " I did command, sir ; but you do now." As he uttered these words, he presented the hilt of his sword to the British commander ; and was instantly run through the body. The Americans had lost but five or six men, when the British entered the fort. A causeless, and furious, carnage commenced immediately upon the death of Ledyard ; and between sixty and seventy Americans were killed on the spot, after they had surrendered their arms, and ceased from every kind of hostility. When this slaughter was finished, the British soldiers loaded a waggon with the wounded, and drew it to the edge of a long, and steep, declivity below the fort ;

whence by its own force it descended violently, until it was stopped at a considerable distance by an apple-tree. A number of these unhappy men died instantly by the shock. The Americans lost on this occasion seventy-three killed : more than thirty were wounded ; and about forty were taken prisoners. The British had two commissioned officers, and forty-six soldiers, killed. Eight officers, with one hundred and thirty-five soldiers, were wounded, several of them mortally.

Arnold made himself master of New-London, without resistance ; and set it on fire. Sixty dwelling-houses, and eighty-four stores, were destroyed by the conflagration. The loss, sustained by the inhabitants, and by the public, was very great ; consisting of naval stores, European, East and West-Indian goods, and provisions ; all of which in large quantities, were assembled in the stores ; and the furniture, provisions, clothing, and other property, contained in the houses. Fifteen vessels, loaded with the property of the inhabitants, sailed up the river. Four remained in the harbour unmolested : while several others, lying at the wharves, became a prey to the conflagration.

No single action of the British, during the Revolutionary war, was more disgraceful, both to those who directed, and those who acted, than this. The murder of Ledyard (for it can be called by no other name,) will cover the British commander with everlasting infamy. The slaughter of his men was a mere, causeless, Indian butchery ; and, to have appeared in its proper character, ought to have been perpetrated with the tomahawk. The treatment of the wounded, which beyond every reasonable doubt was ordered by the commanding officer, would have staggered even the cruelty of Savages. The men, sacrificed by these lawless outrages of principle and decency, had fought bravely in defence of themselves, their families, and their country ; and would by other British officers, have been respected, and honoured, for the manly resolution, which, fresh from their farms, work-shops, and counting-houses, they had so signally shewn in the defence.

Ledyard was deeply regretted by his countrymen, as a brave, sensible, polished, honest, and noble-minded citizen ; who had fallen in a magnanimous attempt to defend his family, friends, and

neighbours; fallen by base hands; fallen by an act of treachery, and brutality, which ought never to have been expected, unless from acknowledged barbarians; and which many barbarians would have disdained to perpetrate. But he fell in the bed of glory; and will be remembered with honour by distant generations.

This enterprise, and the execution of it, were exactly fitted to the character of the man, by whom it was conducted. In this country, indeed, it can be scarcely said to have deepened the dye of his infamy. The conflagration of New-London, and of the little village in Groton, opposite to it, was not of the least use to the British cause, army, or nation. The consumption of naval stores and other goods, and of the public provisions, might, perhaps, find a vindication in the customary proceedings of war; and be considered as in some measure weakening an enemy. The loss was undoubtedly felt; but contributed nothing to dispirit the resolution, or slacken the efforts, of the Americans. The destruction of private dwellings, and private property, produced no other effects, beside extending personal and domestic sufferings, and riveting animosity, contempt, and revenge, against their authors.

The number of inhabitants in New-London, then including Montville and Waterford, was, in the year 1756, 3,171; in 1774, 5,366; in 1800, in New-London and Waterford, 5,150; in Montville, 2,233; in 1810, in New-London alone, 3,238; in Montville 2,187; in Waterford 2,185: total 7,610.

New-London is the port of entry for a considerable part of the foreign commerce carried on by the inhabitants of Connecticut Valley, of the whole commerce of Norwich; and of Stonington, Groton, and several other towns in the County of New-London. The amount of this may be conjectured from the following abstract of duties.

Years.	Duties.	Years.	Duties.
1801	- - - \$78,478	1806	- - - \$214,940
1802	- - - 94,656	1807	- - - 201,838
